Top Production Close to Threshold

- How to compute
- Result

Motivation

Huge top quark sample

Good template for physics case study and understanding detectors.

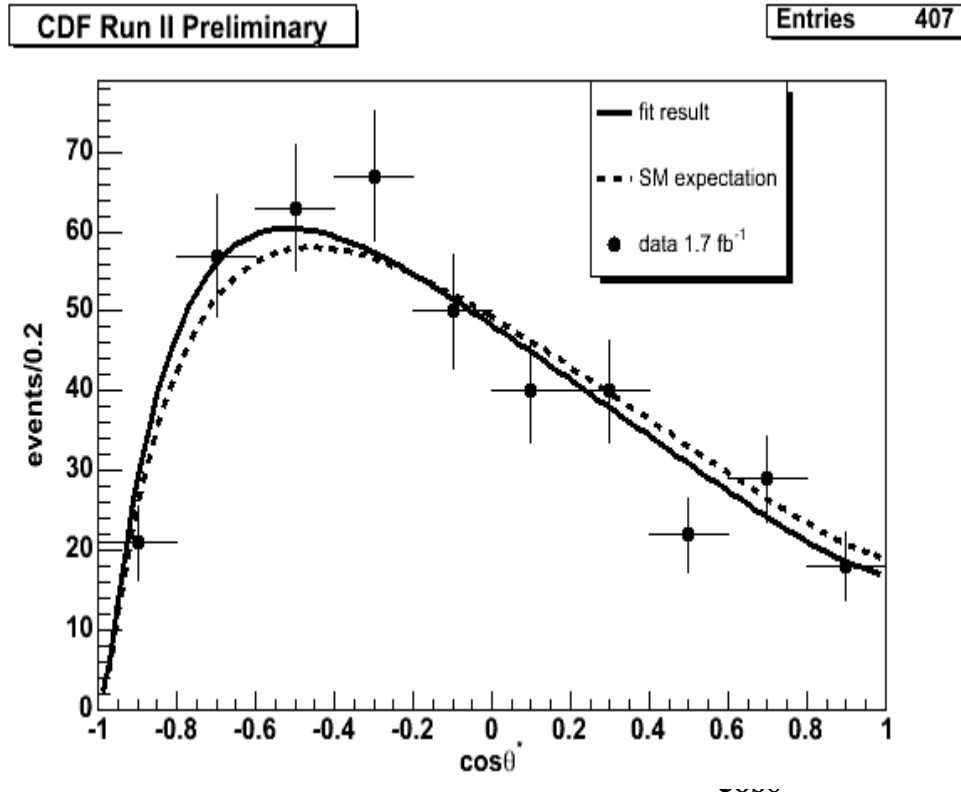

10 fb^{-1} , after cuts

- $\ell + 4$ jets
(with at least 1 b -tag) $8 \times 10^5 \ t\bar{t}$
- dilepton mode
(without b -tag) $8 \times 10^4 \ t\bar{t}$
(with at least 1 b -tag) $6 \times 10^4 \ t\bar{t}$

Reference: Top event reconstruction @ Tevatron

Kinematical reconstruction using likelihood fitting

lepton+4jet mode, 1 or 2b tag

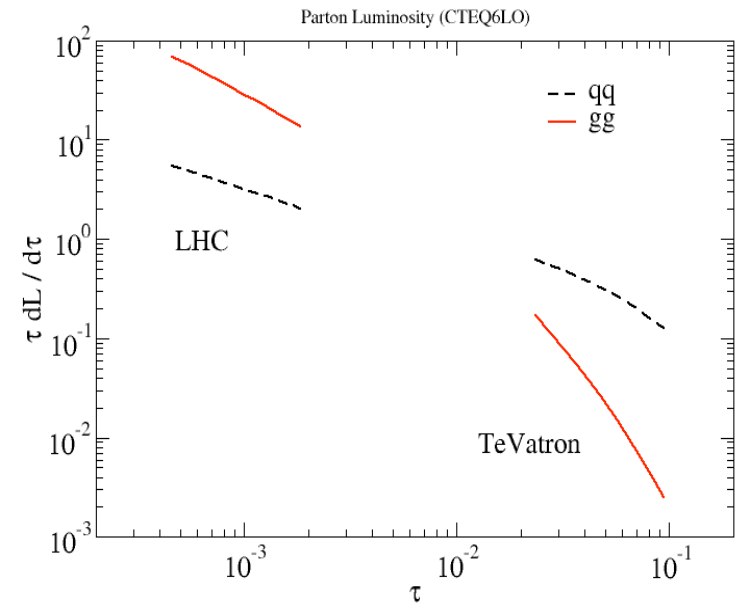

$t\bar{t}$ Production Close to Threshold

Dominant resonance contribution

$$J = 0, \quad CP = - ; \text{ color singlet} \\ (L = 0, \quad S = 0)$$

Effective operator $\epsilon^{\mu\nu\rho\sigma} G_{\mu\nu} G_{\rho\sigma} \phi(t\bar{t})$

How to compute top production cross section

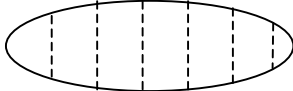

ISR and boundstate effects factorize:

$$\begin{aligned} \hat{\sigma}(\hat{s})_{\text{ISR}+\phi(t\bar{t})} &= \int ds' \sigma(s')_{gg \rightarrow \phi(t\bar{t})} \\ &\times \left[\delta\left(1 - \frac{s'}{\hat{s}}\right) + \int \frac{d^3\vec{k}}{(2\pi)^3 2k^0} C_A 4\pi\alpha_s \frac{2k_1 \cdot k_2}{(k_1 \cdot k)(k_2 \cdot k)} \delta\left(1 - \frac{s'}{\hat{s}} - \frac{2k^0}{\sqrt{\hat{s}}}\right) + \dots \right] \\ &\times \frac{(1 + C_{\text{hard}} \alpha_s)}{\text{Hard vertex corr.}} \quad \text{ISR} \quad \text{Dawson} \end{aligned}$$

where boundstate effects are included in

$$\sigma(s')_{gg \rightarrow \phi(t\bar{t})} \propto \text{Im} \underline{G(0; E' + i\Gamma_t)} \quad ; \quad E' = \sqrt{s'} - 2m_t$$

Green fn  resums $c_0 + c_1 \left(\frac{\alpha_s}{\beta'}\right) + c_2 \left(\frac{\alpha_s}{\beta'}\right)^2 \dots$ Fadin, Khoze

Then convolute with gluon PDF

Result

LHC, gg, color-singlet, spin-0 Yokoya

$$\sigma(s)_{pp \rightarrow t\bar{t}} \Big|_{\text{singlet, spin 0}} = \int dE \frac{d\sigma}{dE}$$

$$\frac{d\sigma}{dE} = \frac{dL}{dE} \hat{\sigma}(\hat{s})_{\text{ISR}+\phi(t\bar{t})} \quad ; \quad \hat{s} = \tau s, \quad E = \sqrt{\hat{s}} - 2m_t$$

Gluon luminosity fn

Rem: Top momentum distr. is also strongly distorted by boundstate effects at $E < 0$.

Kinematical reconstruction using likelihood fitting

Tsuno, Tanaka, Nakano, Y.S.

5 free params:

Energy of jets (4), boost vector (1)

Likelihood function :

$$L = \prod_{i=1}^4 P_{E_T}^i (E_T^{obs.}, E_T^i) \cdot P_{\Gamma_{W^+}} \cdot P_{\Gamma_{W^-}} \cdot P_{\Gamma_t} \cdot P_{\Gamma_{\bar{t}}} \cdot P_{PDF}$$

jet E_T response function

W and top mass constrain with Breit Wigner mass

constrain by PDF
 $(x_{1(2)} = (E_{CM} \pm P_{Z_{CM}}) / 2E_{beam})$
