 There is very strong evidence that we are living in a de-Sitter vacuum with a very small positive cosmological constant Λ,

$$\Lambda \sim +10^{-122} M_P^4$$

Why dark energy contributes 70% of the content of our universe ? Why not 99.9999999....999999% ?

Basic Idea The Large Volume Scenario in Type IIB String Theory Single Kähler Modulus Model Multi-Complex Structure Moduli Summary

 $10^{500}$  possible solutions with different  $\Lambda$  values. Pressing Question The Stringy Mechanism

イロト イポト イヨト イヨト

 There is very strong evidence that we are living in a de-Sitter vacuum with a very small positive cosmological constant Λ,

$$\Lambda \sim +10^{-122} M_P^4$$

- Why dark energy contributes 70% of the content of our universe ? Why not 99.9999999....999999% ?
- There is strong evidence that our universe has gone through an inflationary period, when the vacuum energy is below the Planck scale but much higher than the TeV scale.

## Pressing Question

String theory may have  $10^{500}$  possible solutions. Surely many will have  $\Lambda$  at about the right value.

Why nature picks such a very small positive  $\Lambda$  ?

- We present a possible Stringy Mechanism why a very small Λ may be preferred.
- We use a simple but non-trivial model to illustrate the main idea. We believe this is the direction to go.

Basic Idea The Large Volume Scenario in Type IIB String Theory Single Kähler Modulus Model Multi-Complex Structure Moduli Summary

 $10^{500}$  possible solutions with different  $\Lambda$  values. Pressing Question The Stringy Mechanism

(ロ) (同) (E) (E) (E)

## Applied to String Theory

Consider a string model with a set of moduli {u<sub>i</sub>}. Treat all parameters {a<sub>j</sub>} in the model as random variables with some probability distributions.

## This peaking behavior of $P(\Lambda)$ at $\Lambda = 0$ is quiet generic.

### The Basic Idea is very simple :

It is based on the properties of the probability distribution of functions of random variables.

Does  $\Lambda$  has the right functional form ? Do the random parameters have the right range and distribution ?

An example :

Consider a set of random variables  $x_i$  (i = 1, 2, ..., n). Let the probability distribution of each  $x_i$  be uniform in the range [-1, +1]. What is the probability distribution of their product z ?

イロト イポト イヨト イヨト

Introduction<br/>Basic IdeaBasic IdeaThe Large Volume Scenario in Type IIB String Theory<br/>Single Kähler Modulus Model<br/>Multi-Complex Structure Moduli<br/>SummaryBasic property<br/>P(z) of  $z = x_1x_2$  and  $z = x_1x_2x_3$ <br/>P(z)Non-interacting case: e.g., Sum of terms<br/>Toy Model

Suppose we have *n* random variables  $x_i$  ( $i = 1, 2, \dots, n$ ), each with probability distribution  $P_i(x_i)$ , where  $\int dx_i P_i(x_i) = 1$ . Let

$$z = f(x_1, x_2, \cdots, x_n)$$

Then the probability distribution P(z) of z is given by

$$P(z) = \int dx_1 P_1(x_1) \, dx_2 P_2(x_2) \cdots dx_n P_n(x_n) \, \delta(f(x_i) - z)$$

$$\int P(z)dz = 1$$

so the probability distribution P(z) of z can always be properly normalized, even when P(z) diverges at z = 0 and/or elsewhere.

- All parameters introduced are treated as random variables with some probability distributions.

(日) (同) (E) (E) (E)

# Approach

- Consider the above simplified Large Volume Scenario (LVS) in Type II B string theory.
- ▶ Introduce the dilation *S*,  $N_K = h^{1,1}$  number of Kähler moduli  $T_k$ , and  $N_{cs} = h^{2,1}$  number of complex structure moduli  $U_i$ .
- All parameters introduced are treated as random variables with some probability distributions.
- ▶ Find the supersymmetric solution w<sub>0</sub> = W<sub>0</sub>|<sub>min</sub> of W<sub>0</sub> for the complex structure moduli and insert this w<sub>0</sub> into V to stabilize the Kähler moduli.
- ► The functional form of Λ = V<sub>min</sub> (and w<sub>0</sub> = W<sub>0</sub>|<sub>min</sub>) in terms of the parameters are non-trivial.

# Single Kähler Modulus Model

- $T_1 = t_1 + i\tau_1$ , with  $\tau_1 = 0$
- Consider the superpotential

$$W = W_0 - A_1 e^{-x}$$

where  $W_0$  and A are (random) parameters and  $x = a_1 t_1$  is the Kähler modulus.

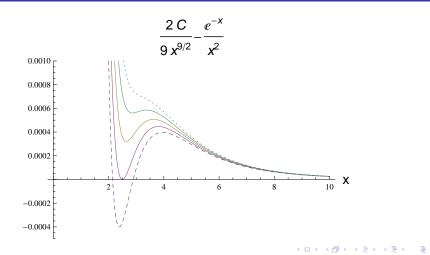

• A stable vacuum can exist at  $x = x_m$ 

$$\Lambda = V_{min} = BW_0A_1\hat{\xi}(x_m - 2.5)$$

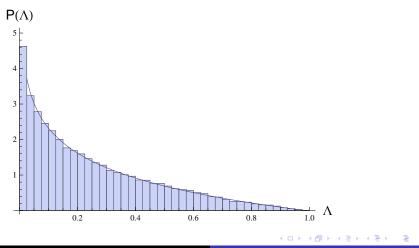

where B is a constant.

• Let us treat  $W_0$  and  $A_1$  as random variables where  $W_0/A_1 \sim C$  is constrained:  $3.65 \lesssim C \lesssim 3.89$ ,  $2.50 \le x_m \lesssim 3.11$ 

# The form of V(x) with $W_0A_1 \leq 0$

# $P(\Lambda) \propto \ln \left( 1/|\Lambda| ight)$ at $\Lambda \sim 0$

K and  $W_0$ Supersymmetric Solution Probability Distribution  $P(w_0)$ Probability Distribution  $P(\Lambda)$  $P(\Lambda)$  as a function of  $h^{2,1} = N$  $P(\Lambda)$  as a function of  $h^{1,1}$ 

#### Multi-Complex Structure Moduli case

$$egin{aligned} &\mathcal{K} = -2\ln(\mathcal{V} + \hat{\xi}/2) - \ln(S + ar{S}) - \sum_{j}\ln(U_{j} + ar{U}_{j}) \ &W = W_{0}(U_{i},S) + \sum_{i=1}^{N_{K}}A_{i}e^{-a_{i}T_{i}} \ &W_{0}(U_{i},S) = c_{1} + \sum_{j}b_{j}U_{j} - s(c_{2} + \sum_{j}d_{j}U_{j}) \end{aligned}$$

Now consider the case with  $N_{cs}$  complex structure moduli  $U_i$  + the dilaton S + 1 Kähler modulus x. We solve for  $U_i$  and S at the supersymmetric point and then insert the resulting  $w_0 = W_{0,min}$  into the Kähler uplift case to solve for x. There are 2n + 6 parameters.

Introduction	$K$ and $W_0$
Basic Idea	Supersymmetric Solution
The Large Volume Scenario in Type IIB String Theory	Probability Distribution $P(w_0)$
Single Kähler Modulus Model	Probability Distribution $P(\Lambda)$
Multi-Complex Structure Moduli	$P(\Lambda)$ as a function of $h^{2,1} = N$
Summary	$P(\Lambda)$ as a function of $h^{1,1}$

$$D_{S}W_{0} = \partial_{S}W_{0} + K_{S}W_{0} = 0, \qquad D_{i}W_{0} = 0$$
$$W_{0}(u_{i}, s) = c_{1} + \sum_{j} b_{j}u_{j} - s(c_{2} + \sum_{j} d_{j}u_{j})$$

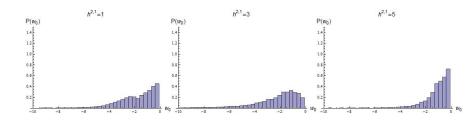

Solution :

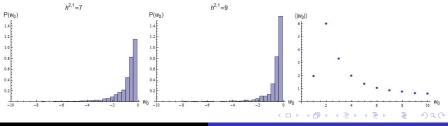

$$(N_{cs} - 2)\frac{c_1 + sc_2}{c_1 - sc_2} = \sum_{i=1}^{N_{cs}} \frac{b_i + sd_i}{b_i - sd_i}$$
$$w_0 = W_0|_{\min} = \frac{2(c_1 + sc_2)\Pi_1^n(b_i - sd_i)}{\sum_i (b_i + sd_i)\Pi_{j \neq i}(b_j - sd_j)}$$

Then insert  $w_0$  into the V for the Kähler moduli and solve :

$$\Lambda = \frac{e^{-5/2}}{9} \left(\frac{2}{5}\right)^2 \frac{-w_0 a_1^3 A_1}{\gamma_1^2} \left(x_m - \frac{5}{2}\right)$$

However, for larger  $h^{2,1}$ , the drop of  $\langle \Lambda \rangle$  slows down appreciably. Pointed out to us by Rummel and Westphal

K and  $W_0$ Supersymmetric Solution Probability Distribution  $P(w_0)$ Probability Distribution  $P(\Lambda)$ P( $\Lambda$ ) as a function of  $h^{2,1} = N$  $P(\Lambda)$  as a function of  $h^{1,1}$ 

## $P(\Lambda)$ as a function of $h^{2,1}$

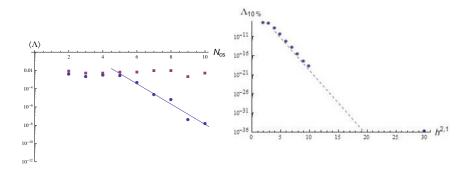

Imposing the conditions  $V_{barrier} \leq 1$ , s > 1 and  $u_i \geq 0$ , for meta-stable vacua :

Introduction	$K$ and $W_0$
Basic Idea	Supersymmetric Solution
The Large Volume Scenario in Type IIB String Theory	Probability Distribution $P(w_0)$
Single Kähler Modulus Model	Probability Distribution $P(\Lambda)$
Multi-Complex Structure Moduli	$P(\Lambda)$ as a function of $h^{2,1} = N$
Summary	$P(\Lambda)$ as a function of $h^{1,1}$

 $P(\Lambda)$  is sharply peaked at  $\Lambda = 0$  but with a long tail. So we ask : what is the cut-off  $\Lambda_{10\%}$  if  $\int_{0}^{\Lambda_{10\%}} P(\Lambda) d\Lambda = 10\%$ ?

-

K and  $W_0$ Supersymmetric Solution Probability Distribution  $P(w_0)$ Probability Distribution  $P(\Lambda)$  $P(\Lambda)$  as a function of  $h^{2,1} = N$  $P(\Lambda)$  as a function of  $h^{1,1}$ 

## $<\Lambda> versus \ \Lambda_{10\%}$

$$\int_0^{\Lambda_{10\%}} P(\Lambda) \, d\Lambda = 10\%$$

That is, there is a 10% chance that  $\Lambda_{10\%} \geq \Lambda \geq 0.$ 

At 
$$\mathit{h}^{2,1}=10$$
,  $<\Lambda>\sim 10^{-8}$  while  $\Lambda_{10\%}\sim 10^{-19}$ 

At 
$$h^{2,1}=$$
 30,  $<\Lambda>\sim 10^{-11}$  while  $\Lambda_{10\%}\sim 10^{-36}$ 

That is, for 30 complex structure moduli, there is a 10% chance that  $\Lambda$  is smaller than  $10^{-36}$ .

 Introduction
 K and  $W_0$  

 Basic Idea
 Supersymmetric Solution

 The Large Volume Scenario in Type IIB String Theory
 Probability Distribution  $P(w_0)$  

 Single Kähler Modulus Model
 Probability Distribution  $P(\Lambda)$  

 Multi-Complex Structure Moduli
  $P(\Lambda)$  as a function of  $h^{2,1} = N$  

 Summary
  $P(\Lambda)$  as a function of  $h^{1,1}$ 

## $P(\Lambda)$ as a function of $h^{1,1}$

When  $W_0$  and  $A_i$  in the model are treated as random variables with uniform distributions in the range [-1, 1]:

 $P(\Lambda = 0)$  is increasing (slowly) as  $h^{1,1}$  increases.

K and  $W_0$ Supersymmetric Solution Probability Distribution  $P(w_0)$ Probability Distribution  $P(\Lambda)$  $P(\Lambda)$  as a function of  $h^{2,1} = N$  $P(\Lambda)$  as a function of  $h^{1,1}$ 

#### Expectation value of $\Lambda$ with peaking $W_0$

Expectation value of  $\Lambda$  with peaking  $W_0$ 

$$\begin{split} \langle |\Lambda| \rangle_{N_{K}=1} = & 0.00251 n^{0.436} e^{-0.791 n}, \\ \langle |\Lambda| \rangle_{N_{K}=2} = & 0.00170 n^{0.457} e^{-0.633 n}, \\ \langle |\Lambda| \rangle_{N_{K}=3} = & 0.00125 n^{0.342} e^{-0.464 n}. \end{split}$$

If the parameters  $A_i$  for the Kähler moduli are also peaked, as expected, then we need a lot less moduli.

New Picture

#### Summary and Remarks

- At high vacuum energies, no stable vacua (because most extrema are unstable)
- At very low vacuum energies, meta-stable vacua begin to appear

Technical questions to be further studied :

- What is the back-reaction due to SUSY breaking ?
- What about higher ( $\alpha'$  and loop) corrections ?
- How about the cosmological light moduli problem ?

The picture is very encouraging: many directions to be explored.
