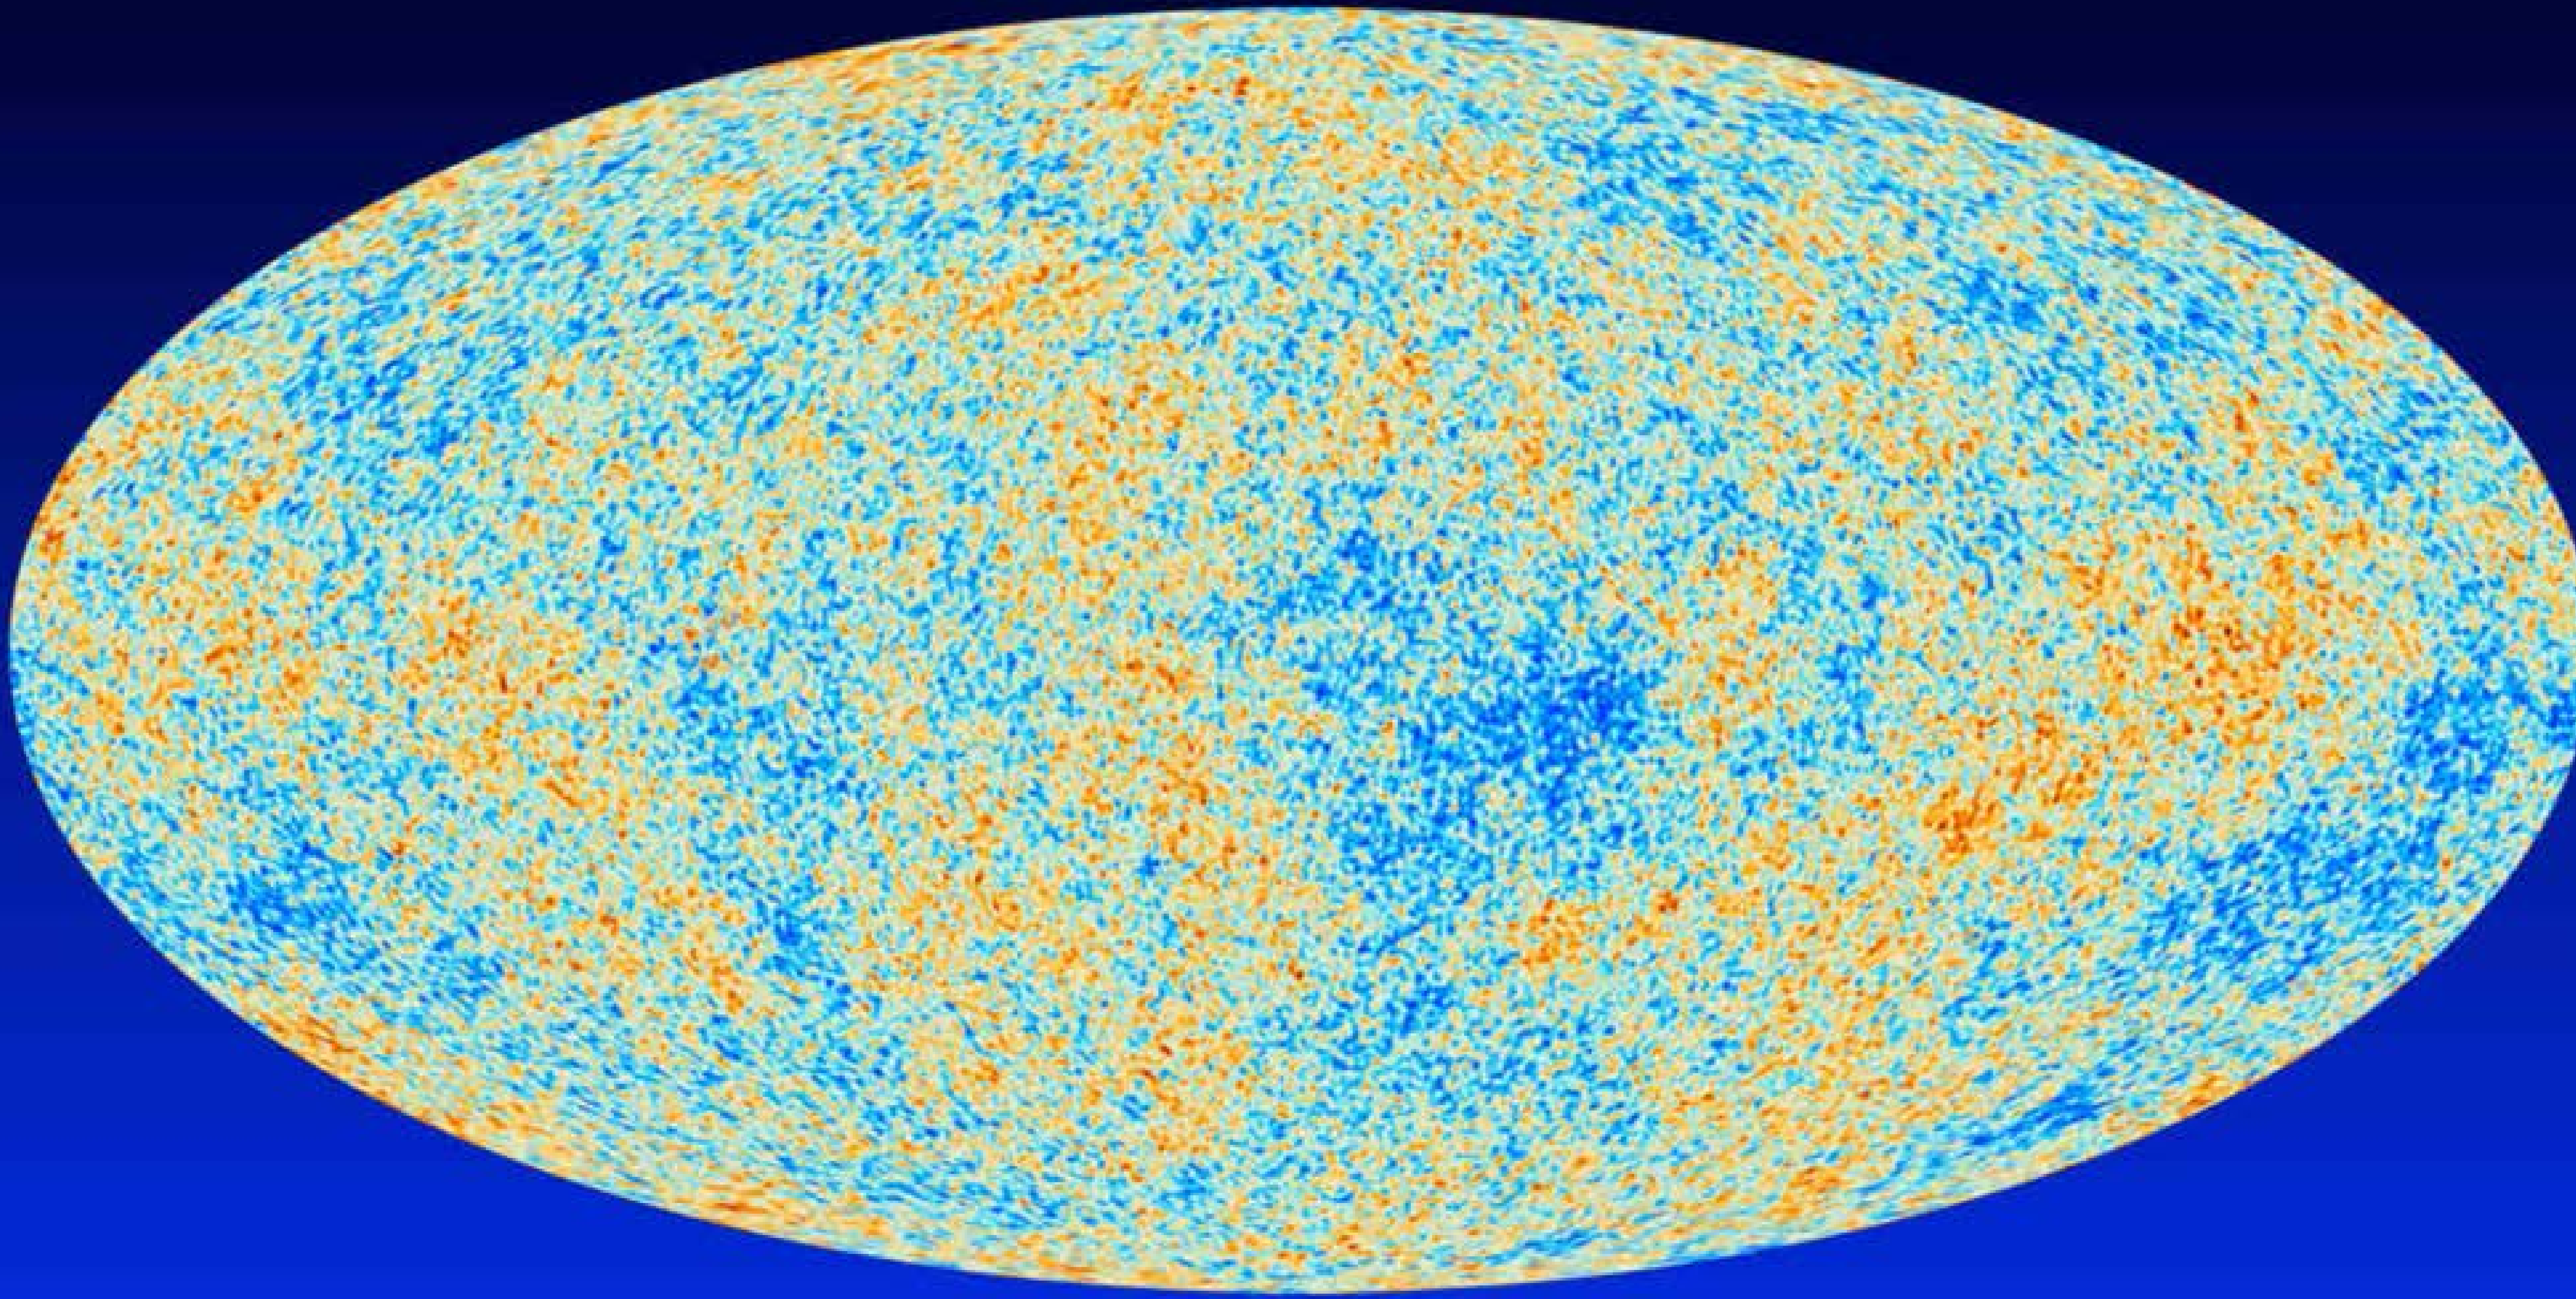
Cosmic Microwave Background Anisotropies



Planck all sky map

- CMB has a blackbody spectrum in every direction
- tiny variations of the CMB temperature $\Delta T/T \sim 10^{-5}$

Cosmic Microwave Background Anisotropies

Planck all sky map

- CMB has a blackbody spectrum in every direction
- tiny variations of the CMB temperature $\Delta T/T \sim 10^{-5}$

Here we are Interested in the CMB Monopole Signal!!!

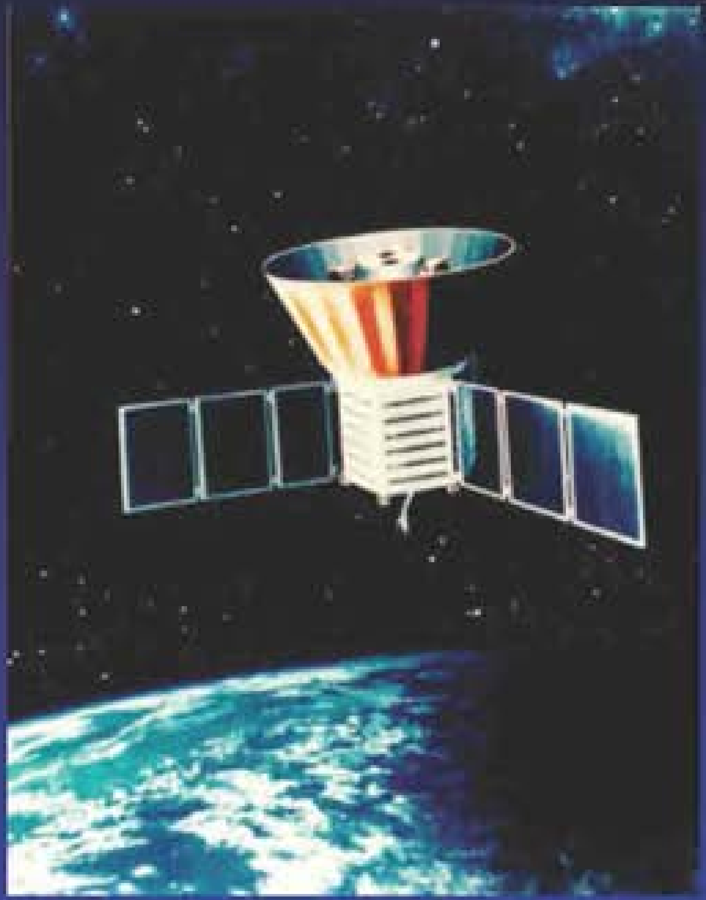
COBE/FIRAS

$$T_0 = (2.726 \pm 0.001)\,\mathrm{K}$$

Mather et al., 1994, ApJ, 420, 439
Fixsen et al., 1996, ApJ, 473, 576
Fixsen, 2003, ApJ, 594, 67
Fixsen, 2009, ApJ, 707, 916

- CMB monopole is 10000 - 100000 times larger than fluctuations!

COBE / FIRAS (Far InfraRed Absolute Spectrophotometer)

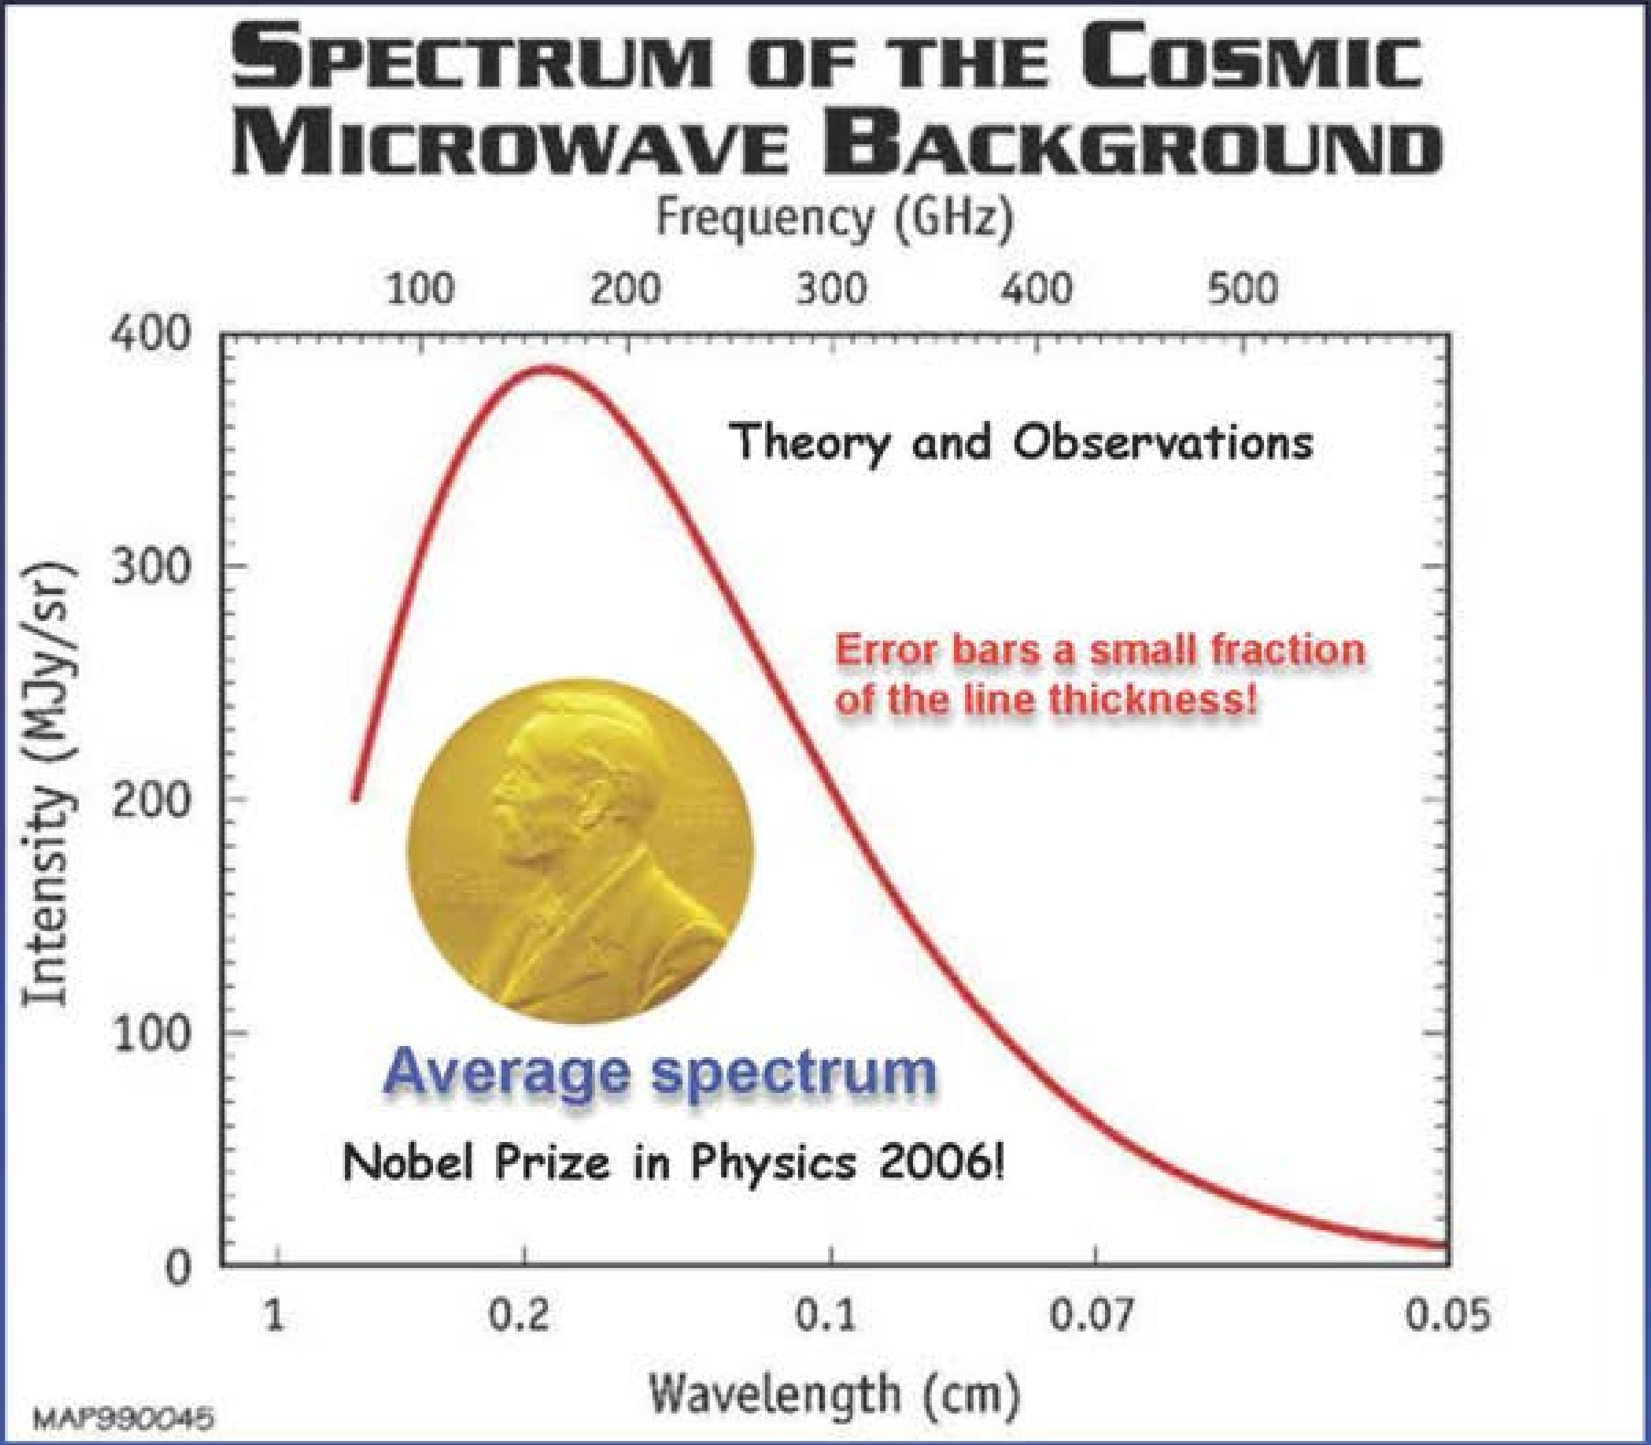


$$T_0 = 2.725 \pm 0.001\,\mathrm{K}$$

$$|y| \leq 1.5\times10^{-5}$$

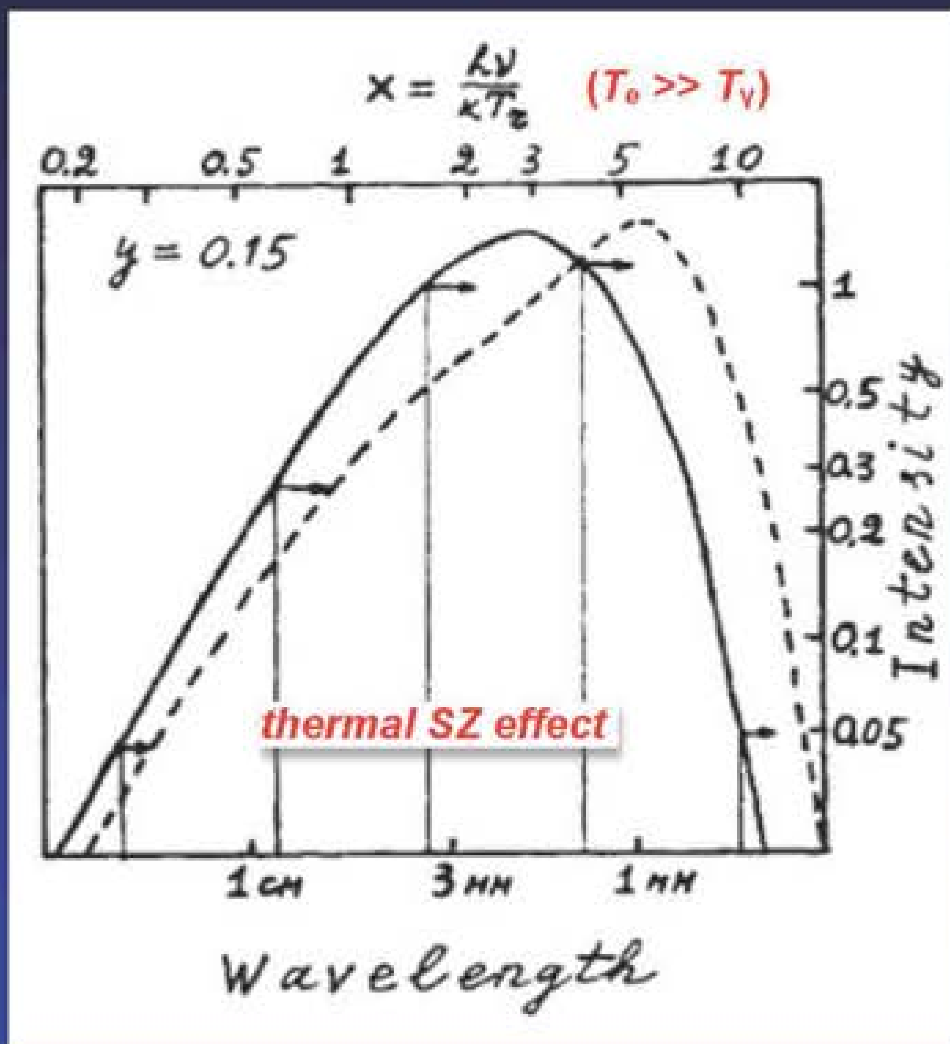
$$|\mu| \leq 9\times10^{-5}$$

Mather et al., 1994, ApJ, 420, 439
Fixsen et al., 1996, ApJ, 473, 576
Fixsen et al., 2003, ApJ, 594, 67



Small Sneak Preview....

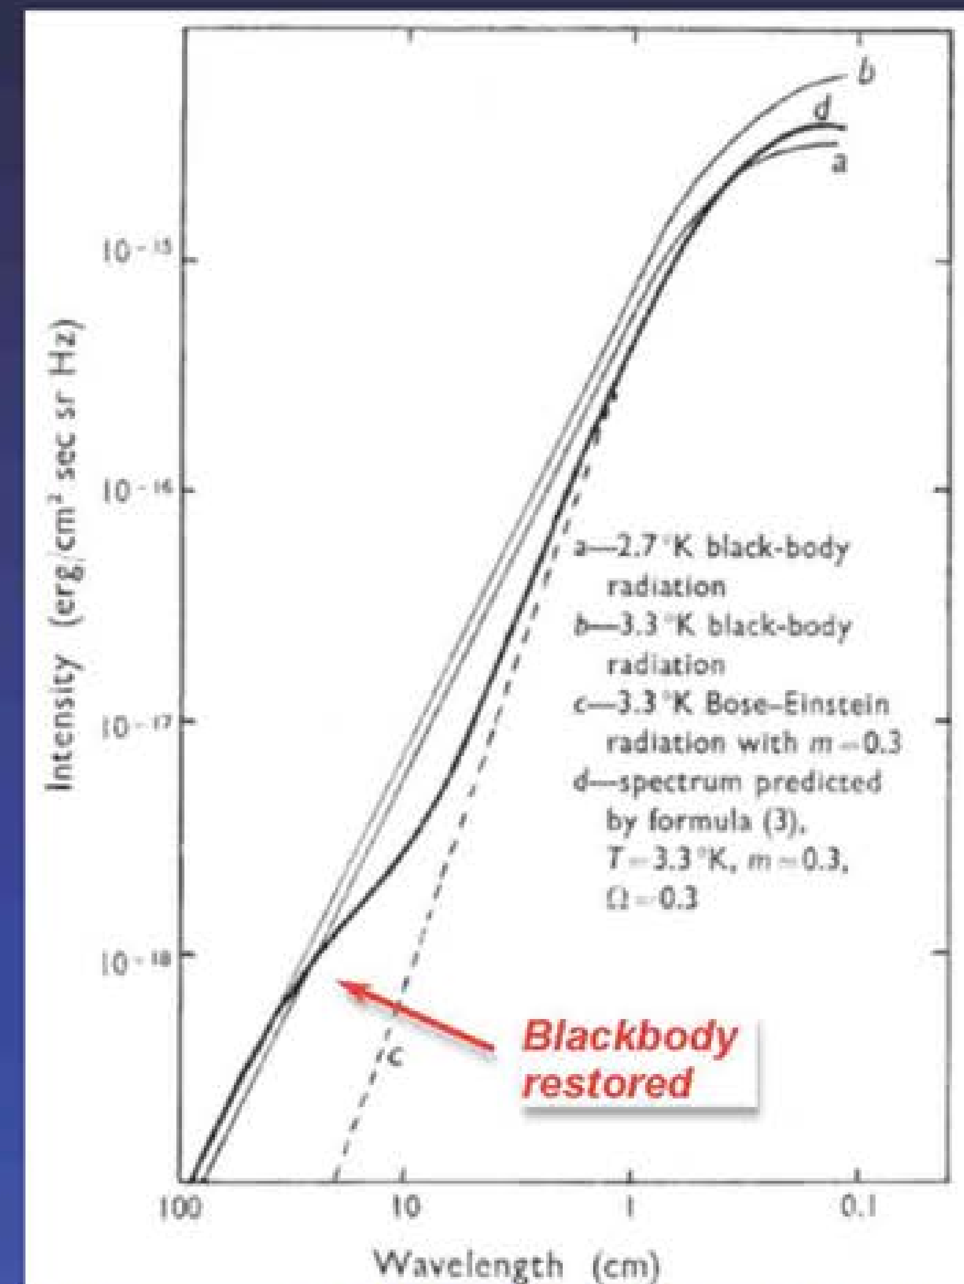
Compton y-distortion



Sunyaev & Zeldovich, 1980, ARAA, 18, 537

- also known from thSZ effect
- up-scattering of CMB photon
- important at late times (z<50000)
- scattering inefficient

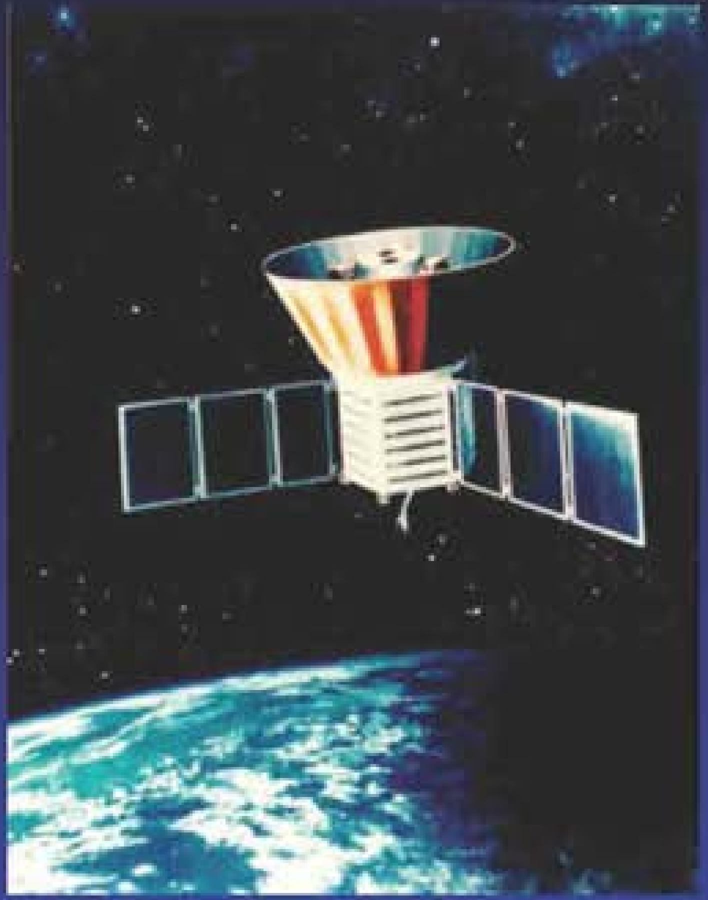
Chemical potential μ-distortion



Sunyaev & Zeldovich, 1970, ApSS, 2, 66

- important at very times (z>50000)
- scattering very efficient

COBE / FIRAS (Far InfraRed Absolute Spectrophotometer)

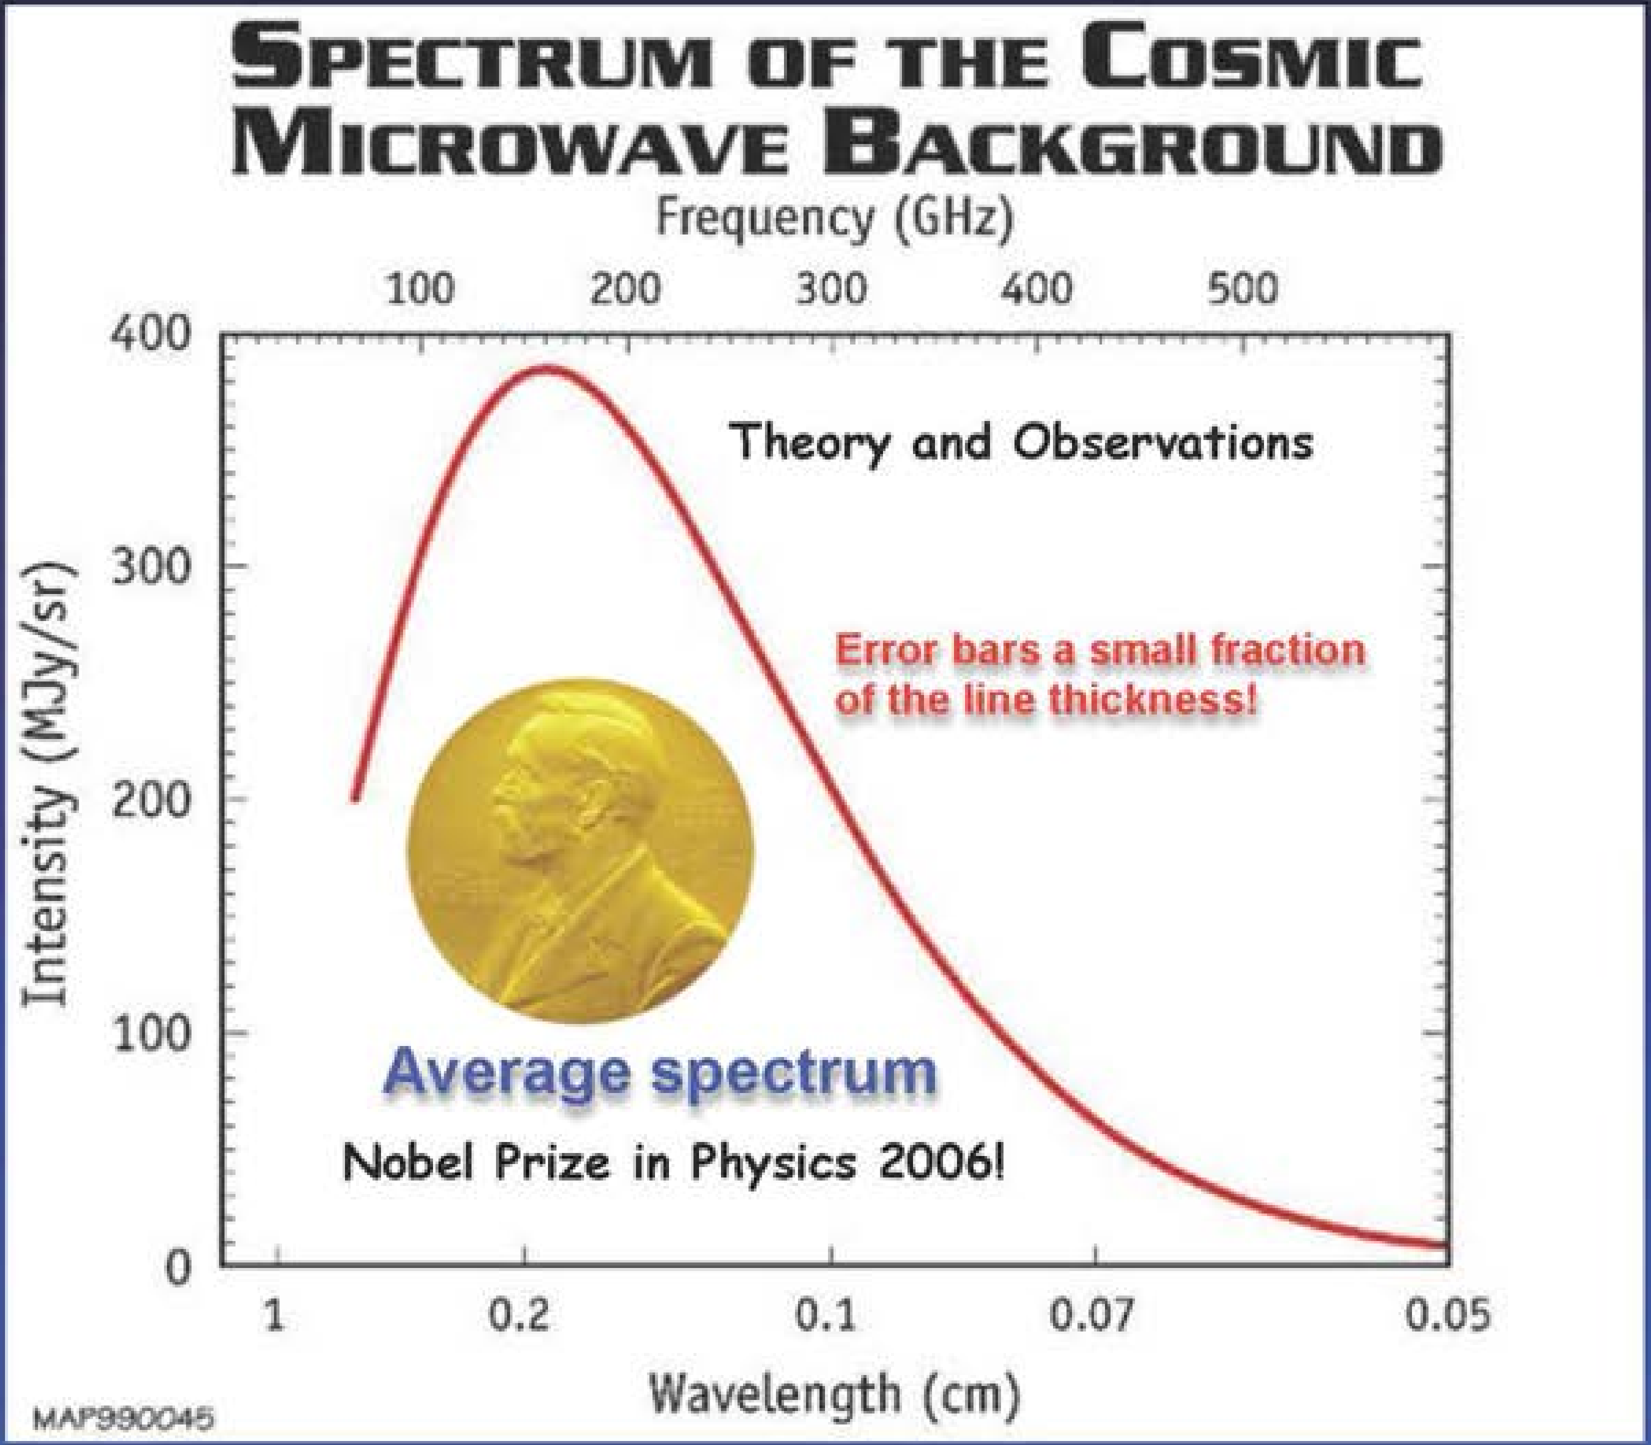


$$T_0 = 2.725 \pm 0.001\,\mathrm{K}$$

$$|y| \le 1.5\times10^{-5}$$

$$|\mu| \le 9\times10^{-5}$$

Mather et al., 1994, ApJ, 420, 439
Fixsen et al., 1996, ApJ, 473, 576
Fixsen et al., 2003, ApJ, 594, 67



Only very small distortions of CMB spectrum are still allowed!

Why should one expect some spectral distortion?

Why should one expect some spectral distortion?

Full thermodynamic equilibrium (certainly valid at very high redshift)

- CMB has a blackbody spectrum at every time (not affected by expansion)
- Photon number density and energy density determined by temperature T_γ

$T_\gamma \sim 2.726\,(1+z)$ K

$N_\gamma \sim 411\ \mathrm{cm}^{-3}\,(1+z)^3 \sim 2\times10^9\,N_b$ (*entropy density dominated by photons*)

$\rho_\gamma \sim 5.1\times10^{-7}\,m_e c^2\ \mathrm{cm}^{-3}\,(1+z)^4 \sim \rho_b \times (1+z) / 925 \sim 0.26\ \mathrm{eV\,cm}^{-3}\,(1+z)^4$

Why should one expect some spectral distortion?

Full thermodynamic equilibrium (certainly valid at very high redshift)

- CMB has a blackbody spectrum at every time (not affected by expansion)
- Photon number density and energy density determined by temperature T_γ

$T_\gamma \sim 2.726\,(1+z)$ K

$N_\gamma \sim 411$ cm^{-3} $(1+z)^3 \sim 2\times10^9\, N_b$ (*entropy density dominated by photons*)

$\rho_\gamma \sim 5.1\times10^{-7}\, m_e c^2$ cm^{-3} $(1+z)^4 \sim \rho_b \times (1+z) / 925 \sim 0.26$ eV cm^{-3} $(1+z)^4$

Perturbing full equilibrium by

- Energy injection (interaction *matter* ←→ *photons*)
- Production of (energetic) photons and/or particles (i.e. change of entropy)

→ CMB spectrum deviates from a pure blackbody

→ thermalization process (partially) erases distortions

(Compton scattering, double Compton and Bremsstrahlung in the expanding Universe)

Why should one expect some spectral distortion?

Full thermodynamic equilibrium (certainly valid at very high redshift)

- CMB has a blackbody spectrum at every time (not affected by expansion)
- Photon number density and energy density determined by temperature T_γ

$T_\gamma \sim 2.726\,(1+z)$ K

$N_\gamma \sim 411\ \text{cm}^{-3}\,(1+z)^3 \sim 2\times10^9\,N_b$ (*entropy density dominated by photons*)

$\rho_\gamma \sim 5.1\times10^{-7}\,m_e c^2\ \text{cm}^{-3}\,(1+z)^4 \sim \rho_b \times (1+z)\,/\,925 \sim 0.26\ \text{eV cm}^{-3}\,(1+z)^4$

Perturbing full equilibrium by

- Production of (energetic) photons and/or particles (i.e. change of entropy)

→ CMB spectrum deviates from a pure blackbody

→ thermalization process (partially) erases distortions

(Compton scattering, double Compton and Bremsstrahlung in the expanding Universe)

Measurements of CMB spectrum place very tight limits on the thermal history of our Universe!

Why bother? No distortion detected so far!??

Physical mechanisms that lead to spectral distortions

- *Cooling by adiabatically expanding ordinary matter*: $T_\gamma \sim (1+z) \leftrightarrow T_m \sim (1+z)^2$
  (JC, 2005; JC & Sunyaev 2011; Khatri, Sunyaev & JC, 2011)
  - continuous *cooling* of photons until redshift z ~ 150 via Compton scattering
  - due to huge heat capacity of photon field distortion very small ($\Delta\rho/\rho \sim 10^{-10}$-$10^{-9}$)

Standard sources of distortions

- Heating by *decaying* or *annihilating* relic particles
  - How is energy transferred to the medium?
  - lifetimes, decay channels, neutrino fraction, (at low redshifts: environments), ...
- *Evaporation of primordial black holes & superconducting strings*
  (Carr et al. 2010; Ostriker & Thompson, 1987; Tashiro et al. 2012)
  - rather fast, quasi-instantaneous but also extended energy release
- *Dissipation of primordial acoustic modes & magnetic fields*
  (Sunyaev & Zeldovich, 1970; Daly 1991; Hu et al. 1994; Jedamzik et al. 2000)
- *Cosmological recombination*

„high" redshifts

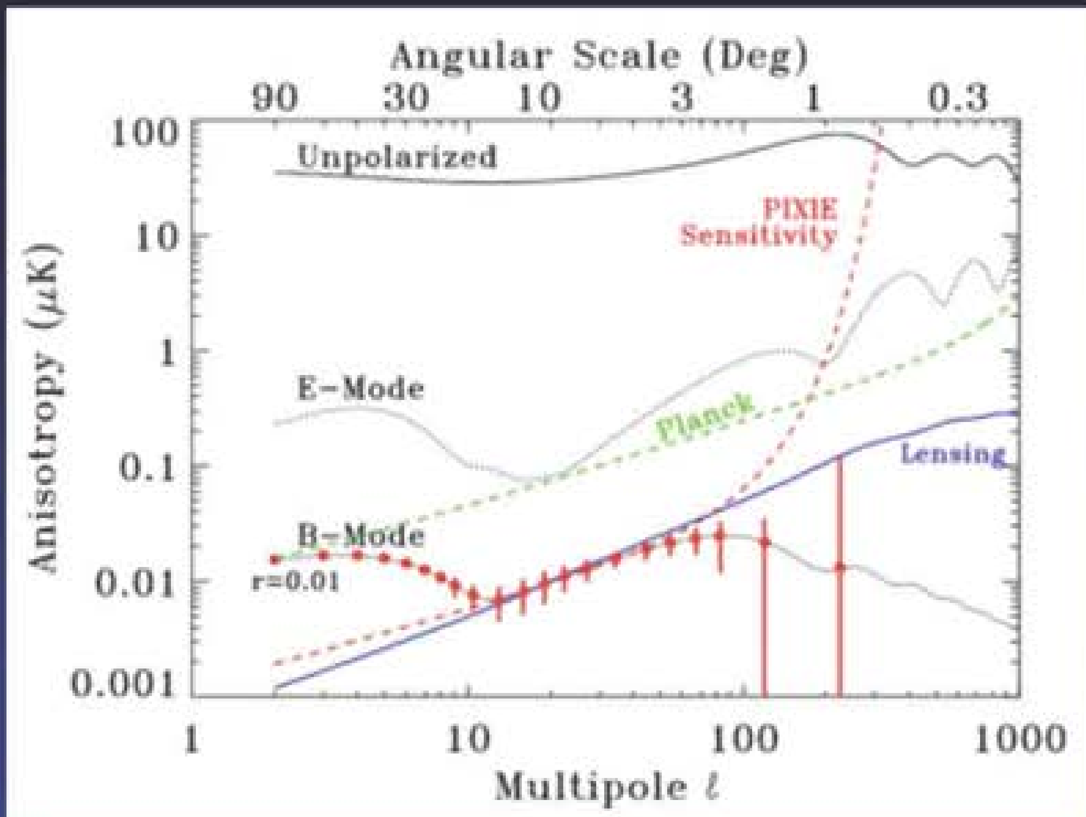
pre-recombination epoch

„low" redshifts

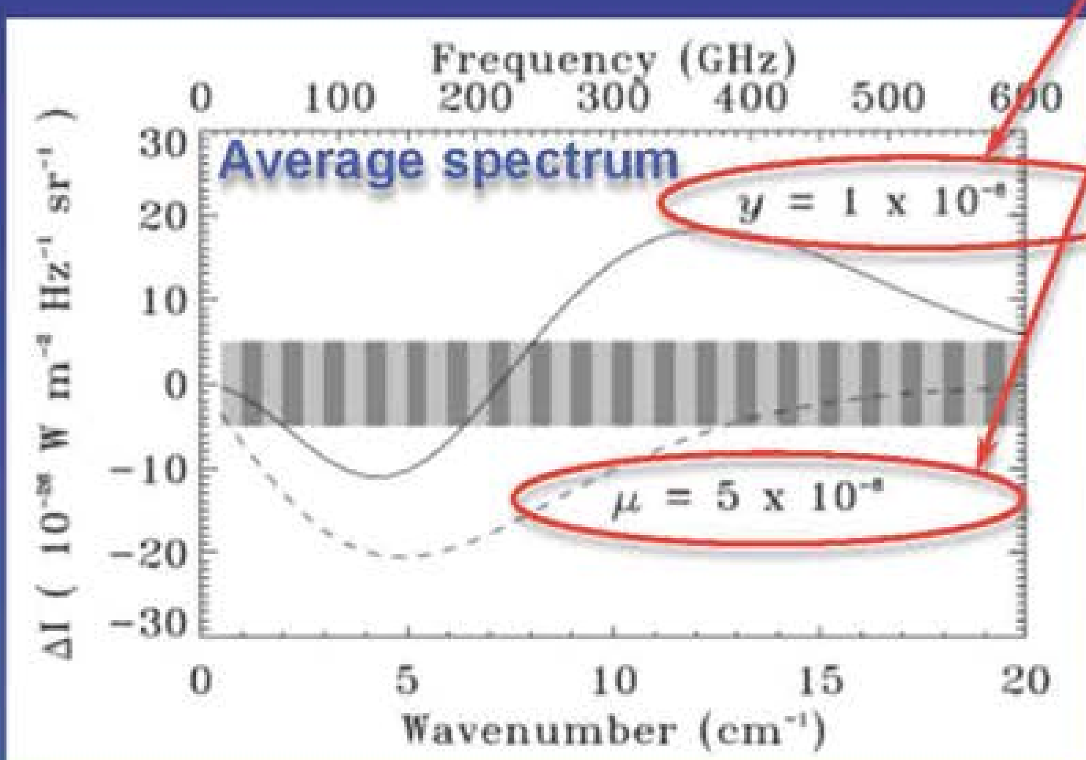
- Signatures due to first supernovae and their remnants
  (Oh, Cooray & Kamionkowski, 2003)
- Shock waves arising due to large-scale structure formation
  (Sunyaev & Zeldovich, 1972; Cen & Ostriker, 1999)
- SZ-effect from clusters; effects of reionization (Heating of medium by X-Rays, Cosmic Rays, etc)

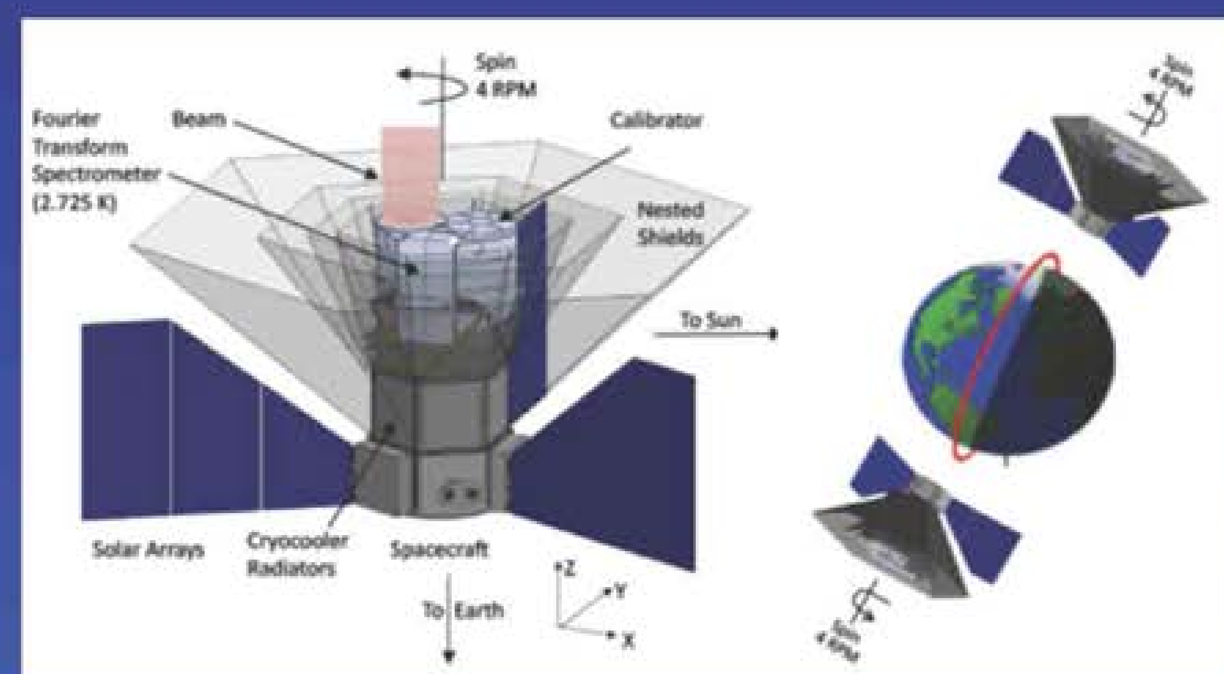
post-recombination

PIXIE: Primordial Inflation Explorer

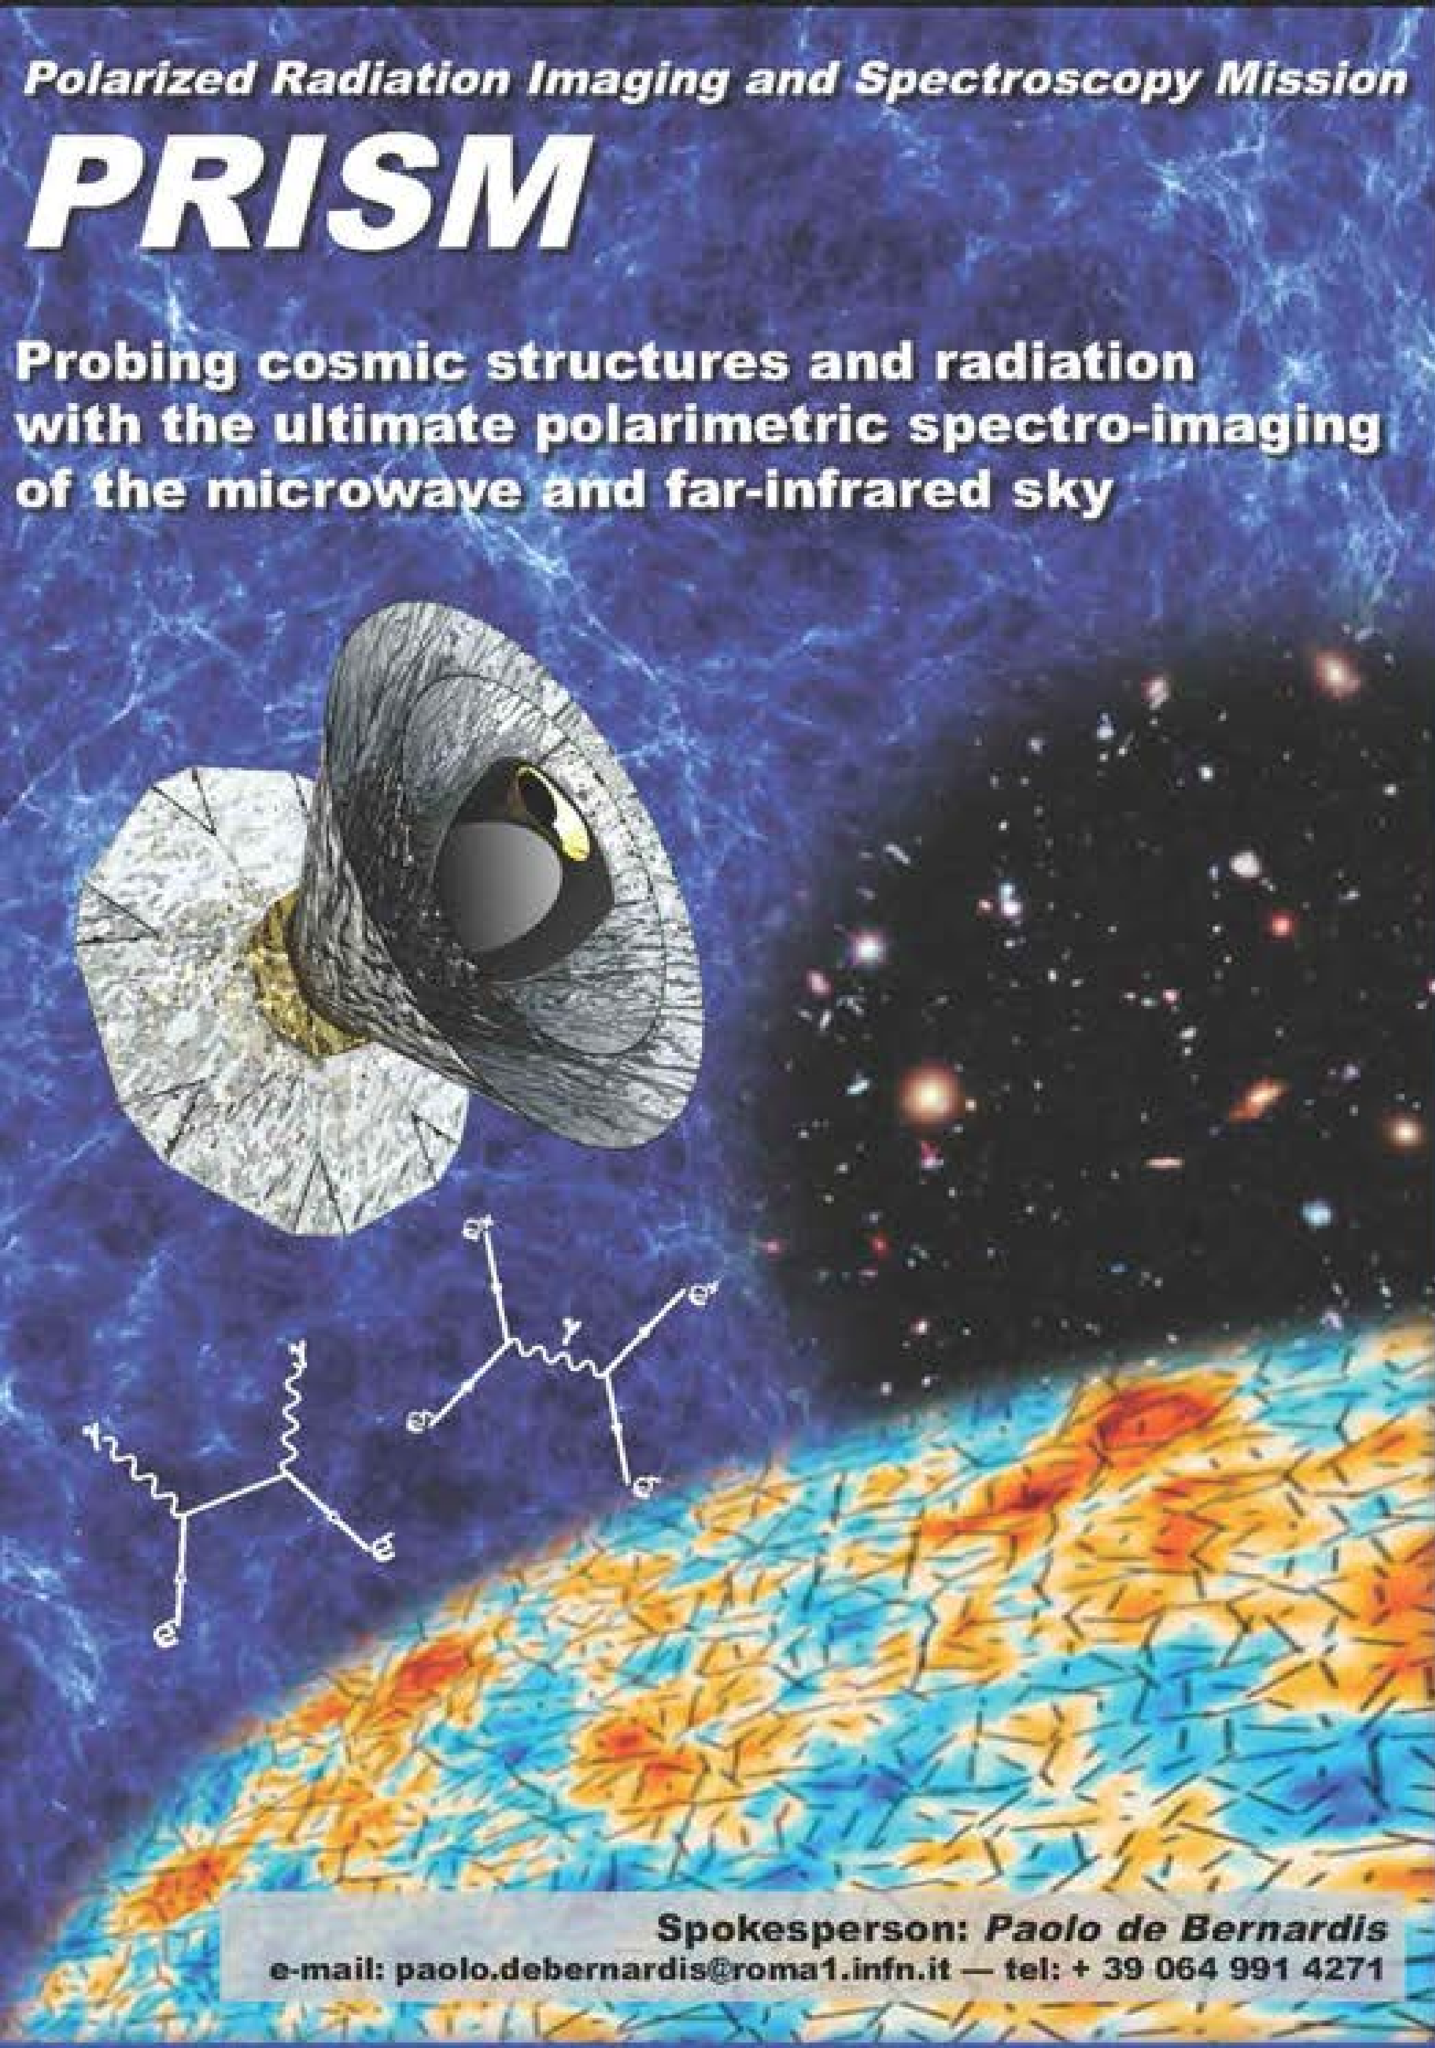


- 400 spectral channel in the frequency range 30 GHz and 6THz ($\Delta\nu \sim$ 15GHz)
- about 1000 (!!!) times more sensitive than COBE/FIRAS
- B-mode polarization from inflation ($r \approx 10^{-3}$)
- improved limits on μ and y
- was proposed 2011 as NASA EX mission (i.e. cost ~ 200 M$)





Kogut et al, JCAP, 2011, arXiv:1105.2044



Instruments:

- L-class ESA mission
- White paper, May 24th, 2013
- Imager:
  - polarization sensitive
  - 3.5m telescope [arcmin resolution at highest frequencies]
  - 30GHz-6THz [30 broad ($\Delta\nu/\nu\sim25\%$) and 300 narrow ($\Delta\nu/\nu\sim2.5\%$) bands]
- Spectrometer:
  - FTS similar to PIXIE
  - 30GHz-6THz ($\Delta\nu\sim15$ & 0.5 GHz)

Some of the science goals:

- B-mode polarization from inflation ($r \approx 5\times10^{-4}$)
- count all SZ clusters $>10^{14}$ M_{sun}
- CIB/large scale structure
- Galactic science
- *CMB spectral distortions*

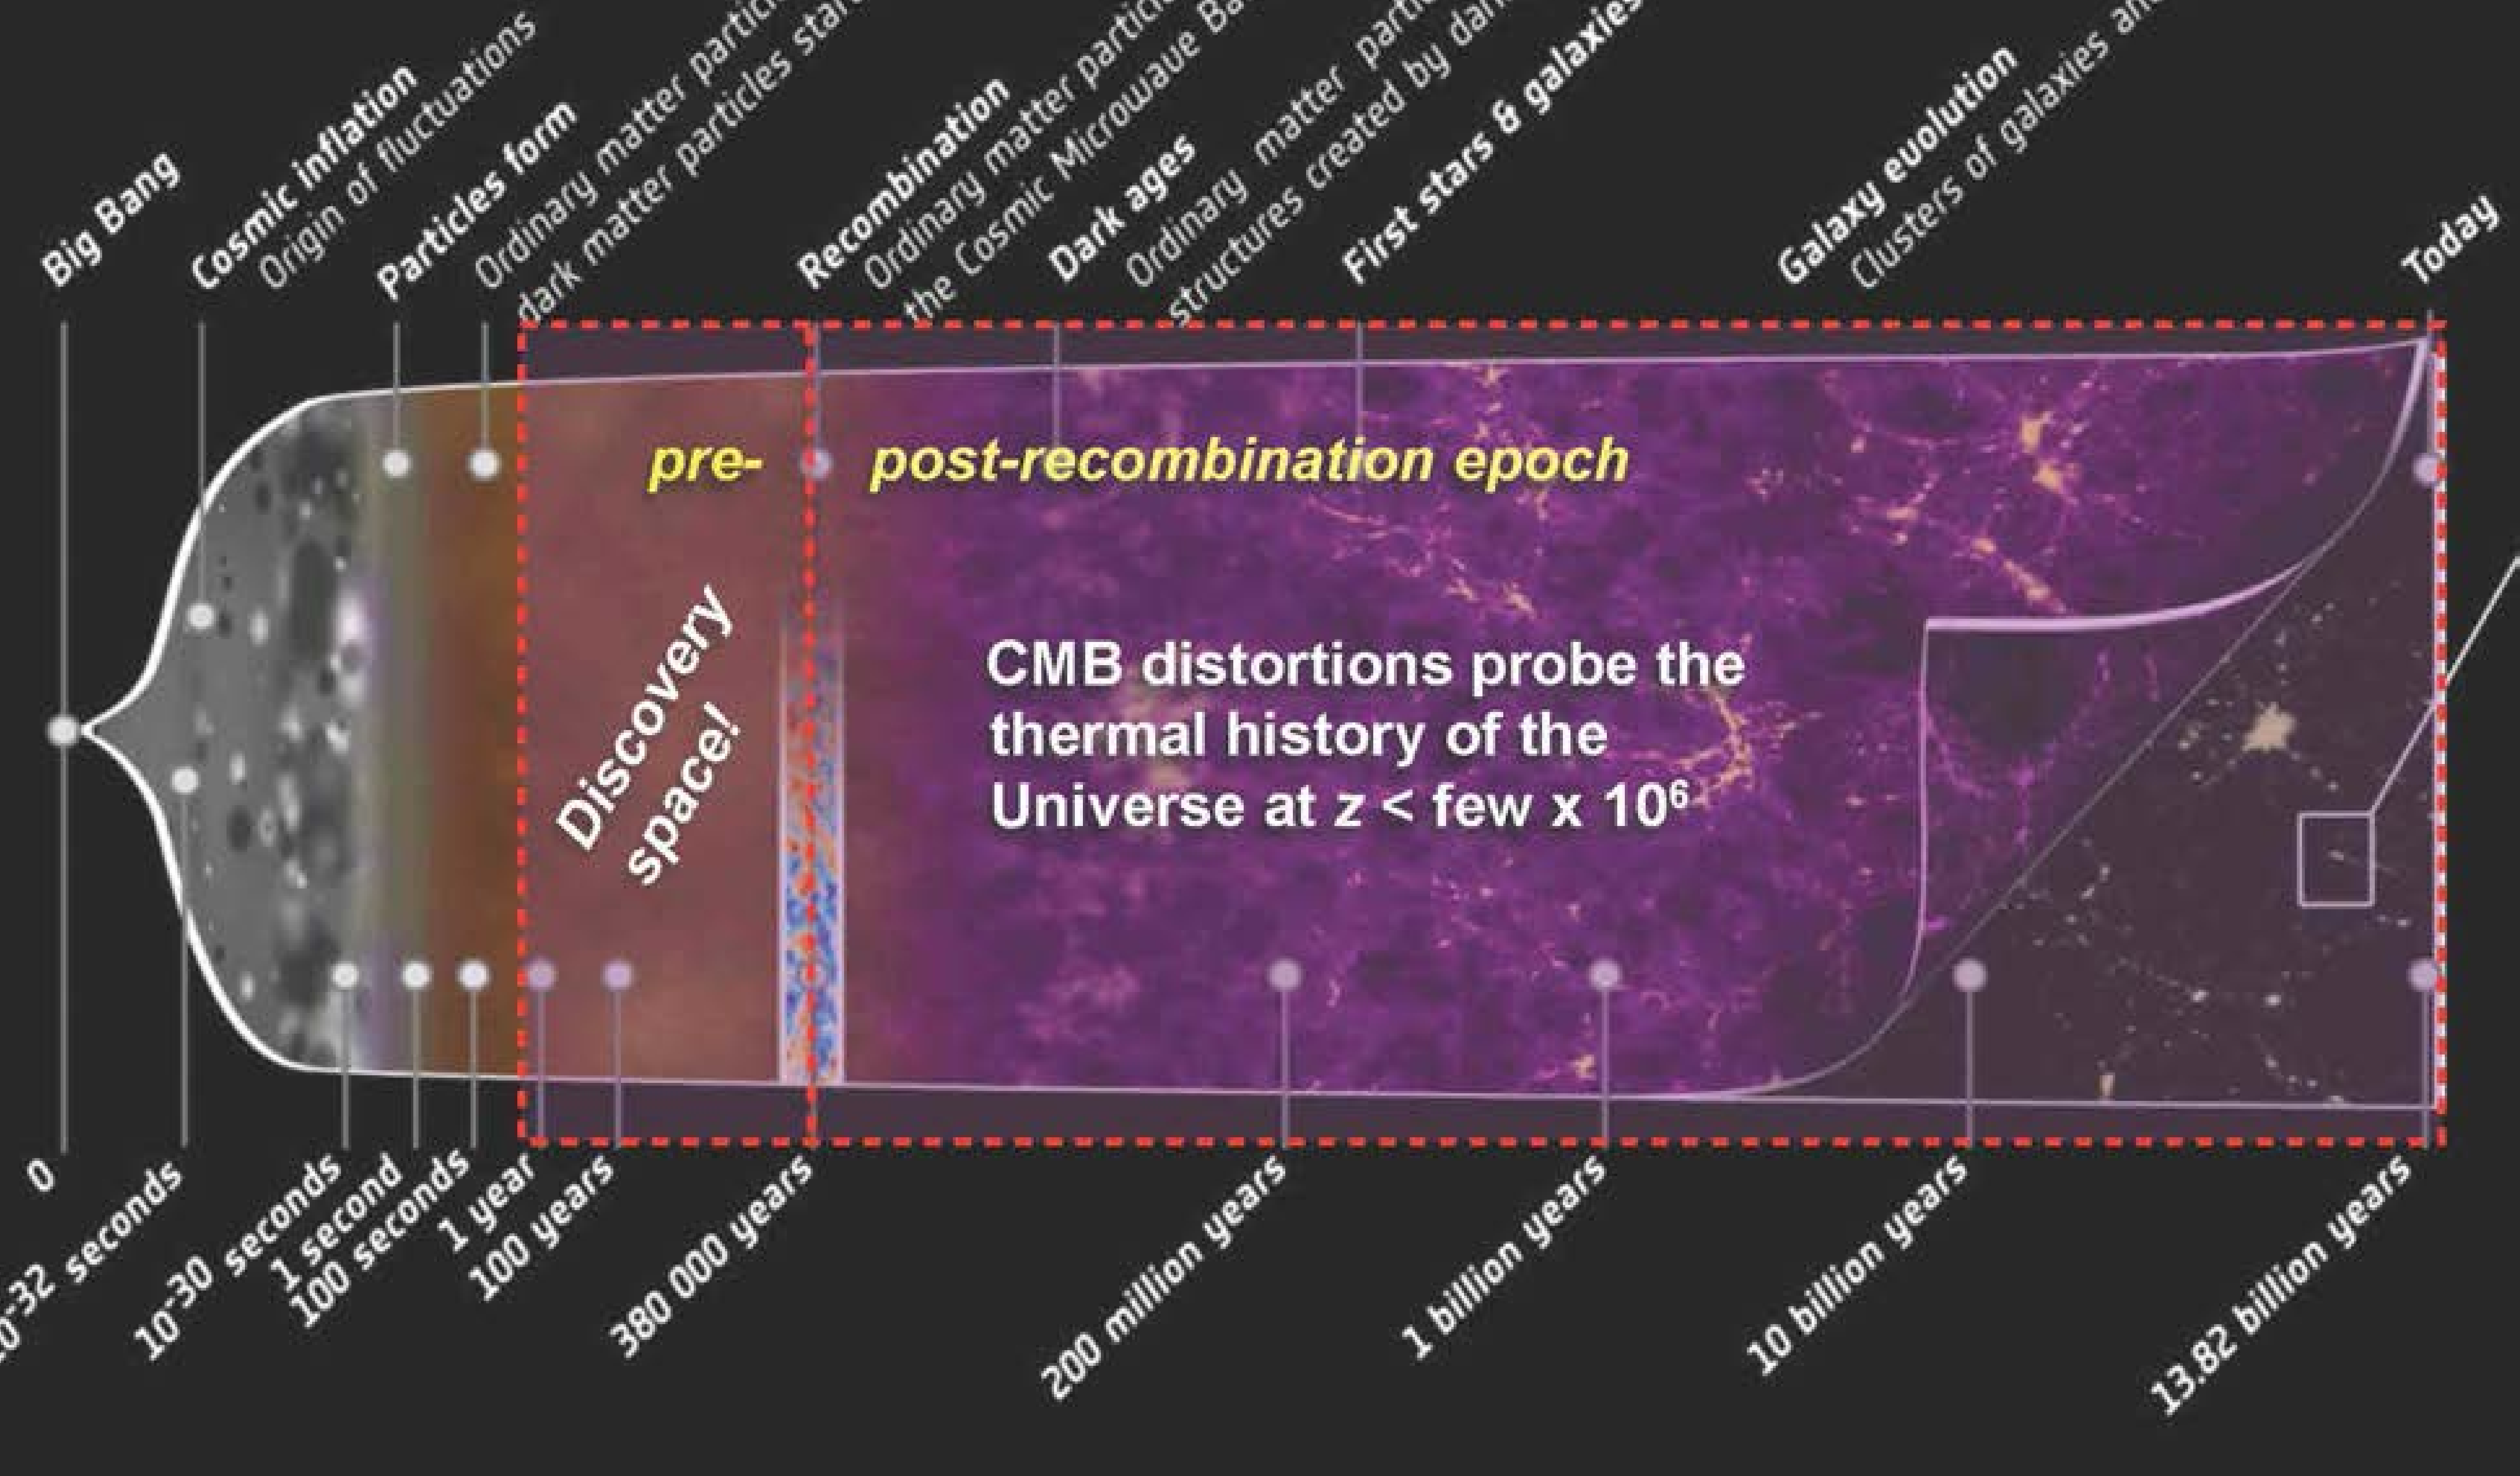
Measurements of CMB spectrum will open a new unexplored window to the early Universe!



How does the thermalization process work?

Some important conditions

- Plasma fully ionized before recombination (z~1000)
  - → free electrons, protons and helium nuclei
  - → photon dominated (~2 Billion photons per baryon)

Some important conditions

- Plasma fully ionized before recombination (z~1000)
  - → free electrons, protons and helium nuclei
  - → photon dominated (~2 Billion photons per baryon)
- Coulomb scattering $e + p \leftrightarrow e' + p$
  - → electrons in full thermal equilibrium with baryons
  - → electrons follow thermal Maxwell-Boltzmann distribution
  - → efficient down to very low redshifts (z ~ 10-100)

Some important conditions

- Plasma fully ionized before recombination (z~1000)

  - → photon dominated (~2 Billion photons per baryon)
- Coulomb scattering $e + p \leftrightarrow e' + p$
  - → electrons in full thermal equilibrium with baryons
  - → electrons follow thermal Maxwell-Boltzmann distribution
  - → efficient down to very low redshifts (z ~ 10-100)
- Medium homogeneous and isotropic on large scales
  - → thermalization problem rather simple!
  - → in principle *allows very precise computations*

Some important conditions

- Plasma fully ionized before recombination (z~1000)

  → free electrons, protons and helium nuclei

  → photon dominated (~2 Billion photons per baryon)

- Coulomb scattering $e + p \leftrightarrow e' + p$

  → electrons in full thermal equilibrium with baryons

  → electrons follow thermal Maxwell-Boltzmann distribution

  → efficient down to very low redshifts (z ~ 10-100)

- Medium homogeneous and isotropic on large scales

  → thermalization problem rather simple!

  → in principle *allows very precise computations*

- Hubble expansion

  → adiabatic cooling of photons [$T_\gamma \sim (1+z)$] and ordinary matter [$T_m \sim (1+z)^2$]

  → redshifting of photons

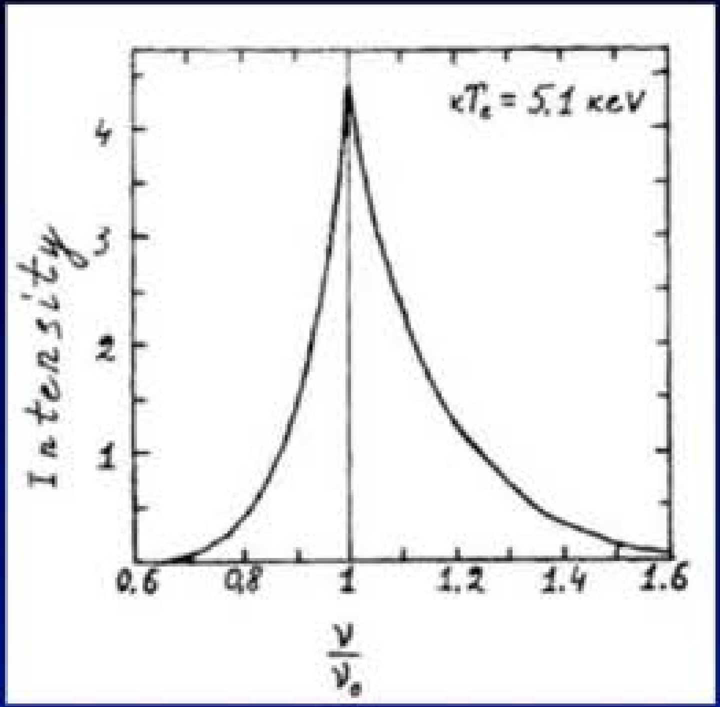
Redistribution of photons by Compton scattering

- Compton scattering $e + \gamma \leftrightarrow e' + \gamma'$

→ *redistribution* of photons in frequency

  - up-scattering due to the ***Doppler*** effect for $h\nu < 4kT_{\rm e}$
  - down-scattering because of ***recoil*** (and stimulated recoil) for $h\nu > 4kT_{\rm e}$
  - ***Doppler*** broadening $\frac{\Delta\nu}{\nu} \simeq \sqrt{\frac{2kT_{\rm e}}{m_{\rm e}c^2}}$

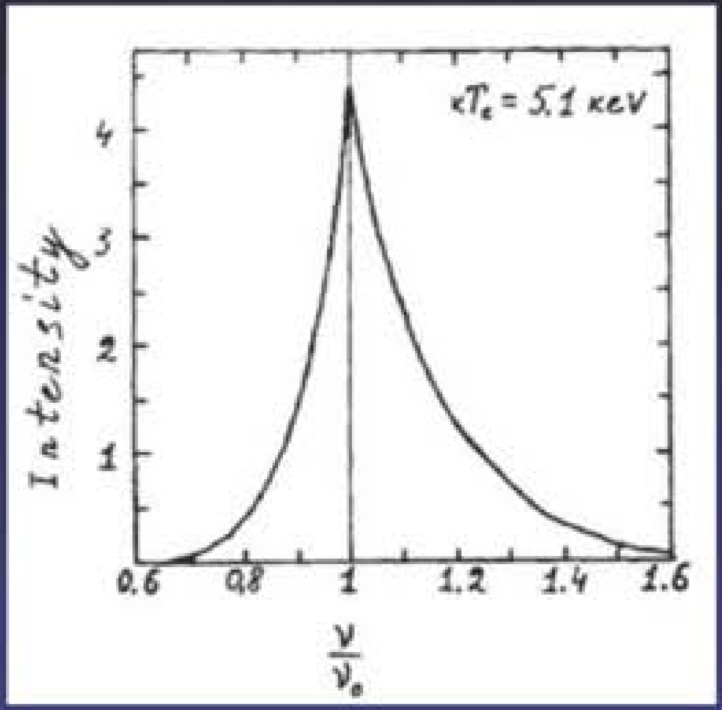
→ strongly couples (free) electrons to the CMB photon down to redshifts *z*~150



Sunyaev& Zeldovich, 1980, Ann. Rev. Astr. Astrophy., 18, pp.537

Redistribution of photons by Compton scattering

- Compton scattering $e+\gamma \leftrightarrow e'+\gamma'$
  - → *redistribution* of photons in frequency
    - up-scattering due to the ***Doppler*** effect for $h\nu < 4kT_e$
    - down-scattering because of ***recoil*** (and stimulated recoil) for $h\nu > 4kT_e$
    - ***Doppler*** broadening $\frac{\Delta\nu}{\nu} \simeq \sqrt{\frac{2kT_e}{m_e c^2}}$
  - → strongly couples (free) electrons to the CMB photon down to redshifts *z*~150

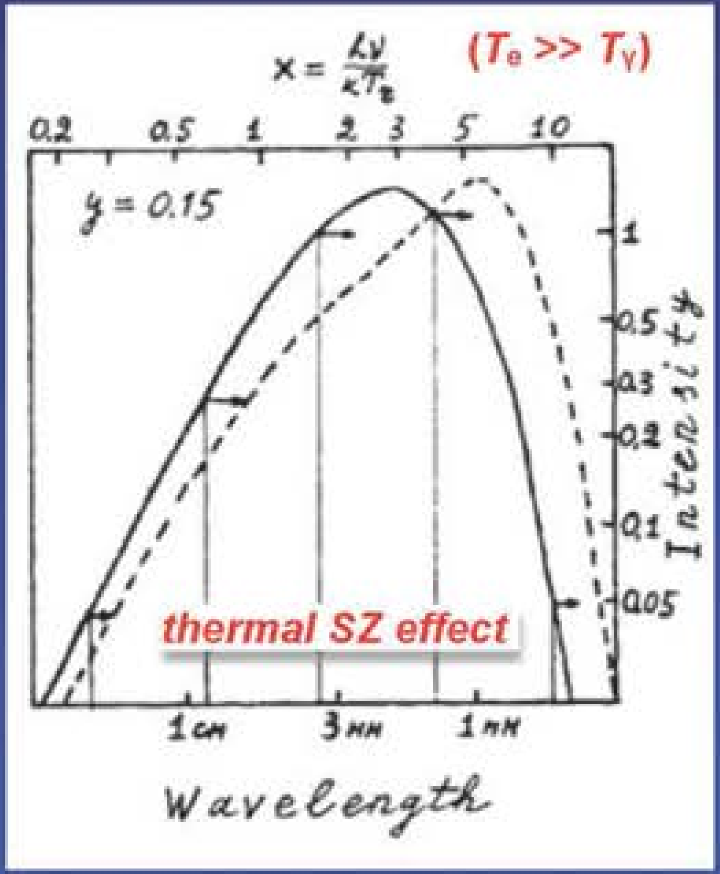


- *Kompaneets Equation* → 'pure' ***y*-distortion**

$$\frac{\Delta I_\nu}{I_\nu} \simeq y \frac{x e^x}{e^x - 1}\left[x\frac{e^x+1}{e^x-1} - 4\right],$$

Temperature difference

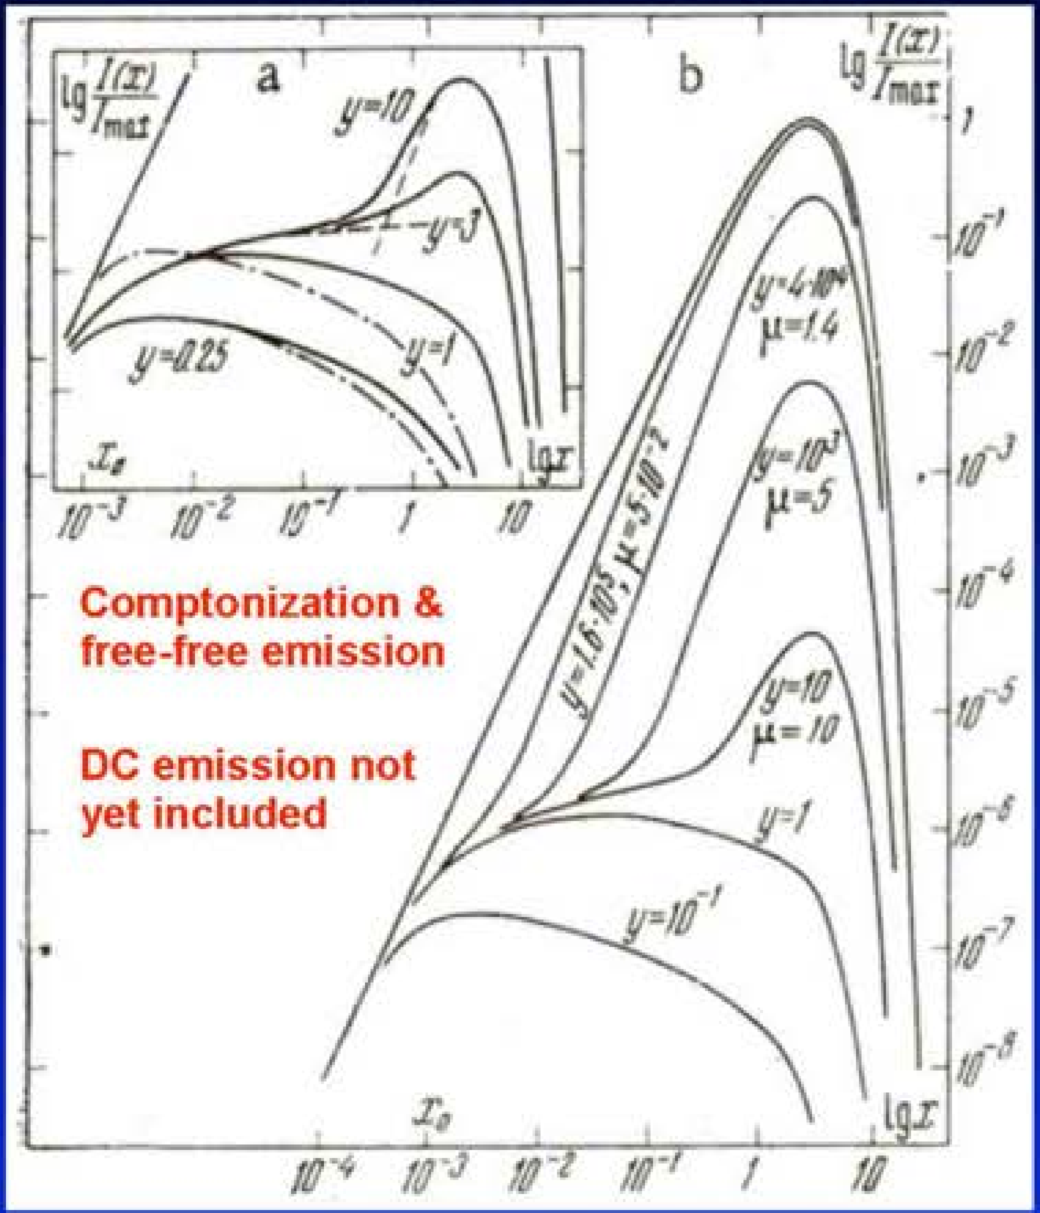
where $x = \frac{h\nu}{kT_\gamma}$ and $y = \int \frac{k(T_e - T_\gamma)}{m_e c^2} \sigma_T n_e \mathrm{d}l << 1$



Sunyaev& Zeldovich, 1980, Ann. Rev. Astr. Astrophy., 18, pp.537

Adjusting the photon number

- Bremsstrahlung $e + p \leftrightarrow e' + p + \gamma$
  - → 1. order α correction to *Coulomb* scattering
  - → production of low frequency photons
  - → important for the evolution of the distortion at low frequencies and late times ($z < 2 \times 10^5$)



Illarionov & Sunyaev, 1975, Sov. Astr, 18, pp.413

- Double Compton scattering (Lightman 1981; Thorne, 1981)

$$e + \gamma \leftrightarrow e' + \gamma' + \gamma_2$$

  - → 1. order α correction to *Compton* scattering
  - → was only included later (Danese & De Zotti, 1982)
  - → production of low frequency photons
  - → very important at high redshifts ($z > 2 \times 10^5$)

Quasi-Exact Treatment of the Thermalization Problem

Quasi-Exact Treatment of the Thermalization Problem

- *For real forecasts of future prospects a precise & fast method for computing the spectral distortion is needed!*

Quasi-Exact Treatment of the Thermalization Problem

- *For real forecasts of future prospects a precise & fast method for computing the spectral distortion is needed!*
- *Case-by-case computation of the distortion (e.g., with CosmoTherm, JC & Sunyaev, 2012, ArXiv:1109.6552) still rather time-consuming*

Quasi-Exact Treatment of the Thermalization Problem

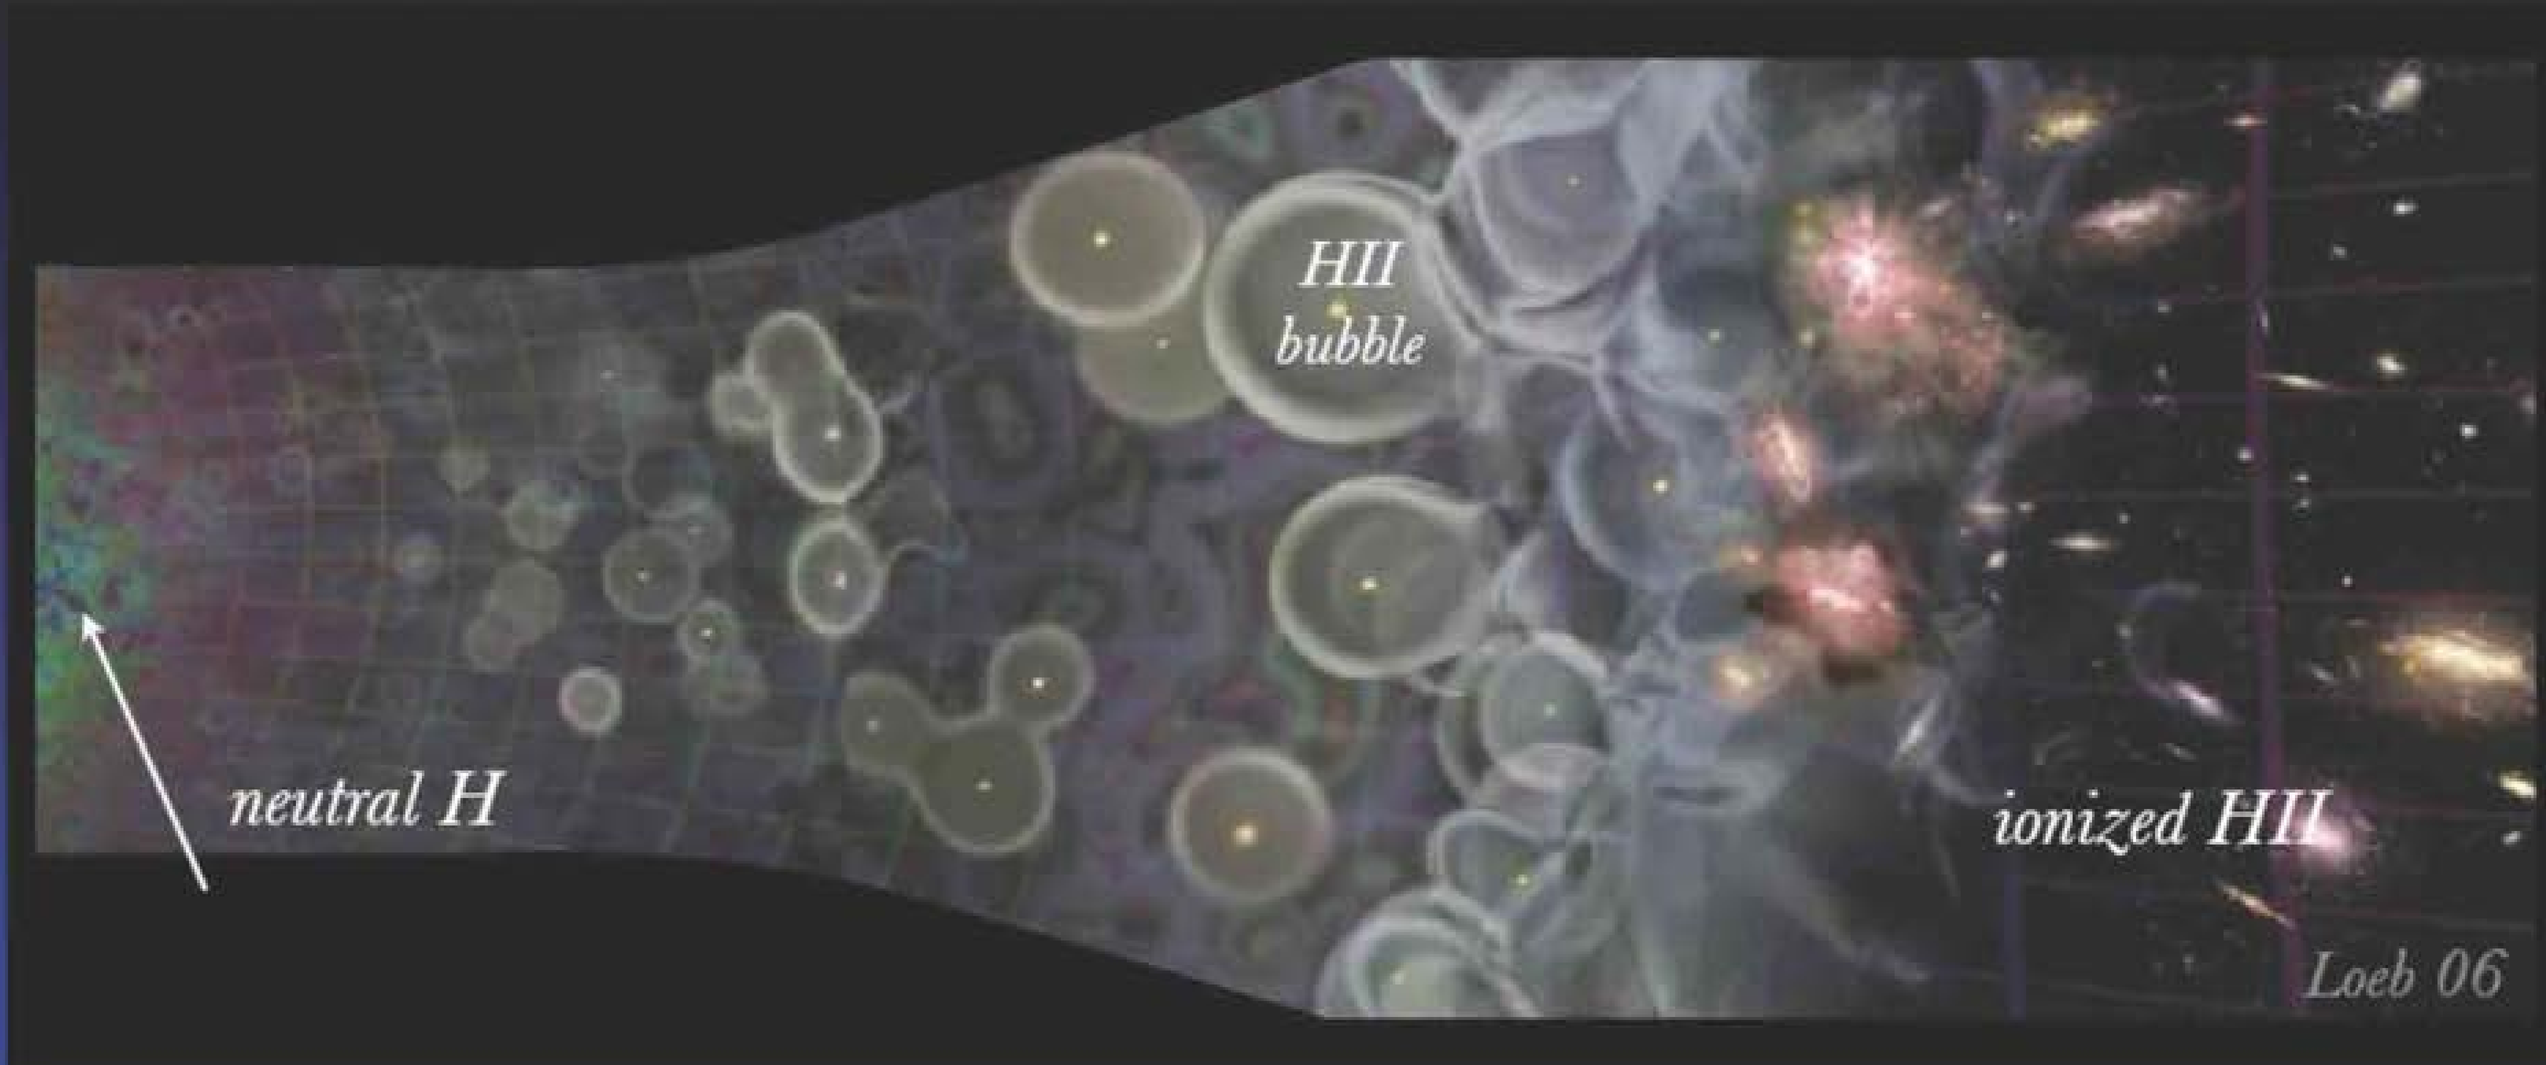
- SZ-effect from clusters; effects of reionization (Heating of medium by X-Rays, Cosmic Rays, etc)

post-recombination

Reionization and structure formation

Simple estimates for the distortion

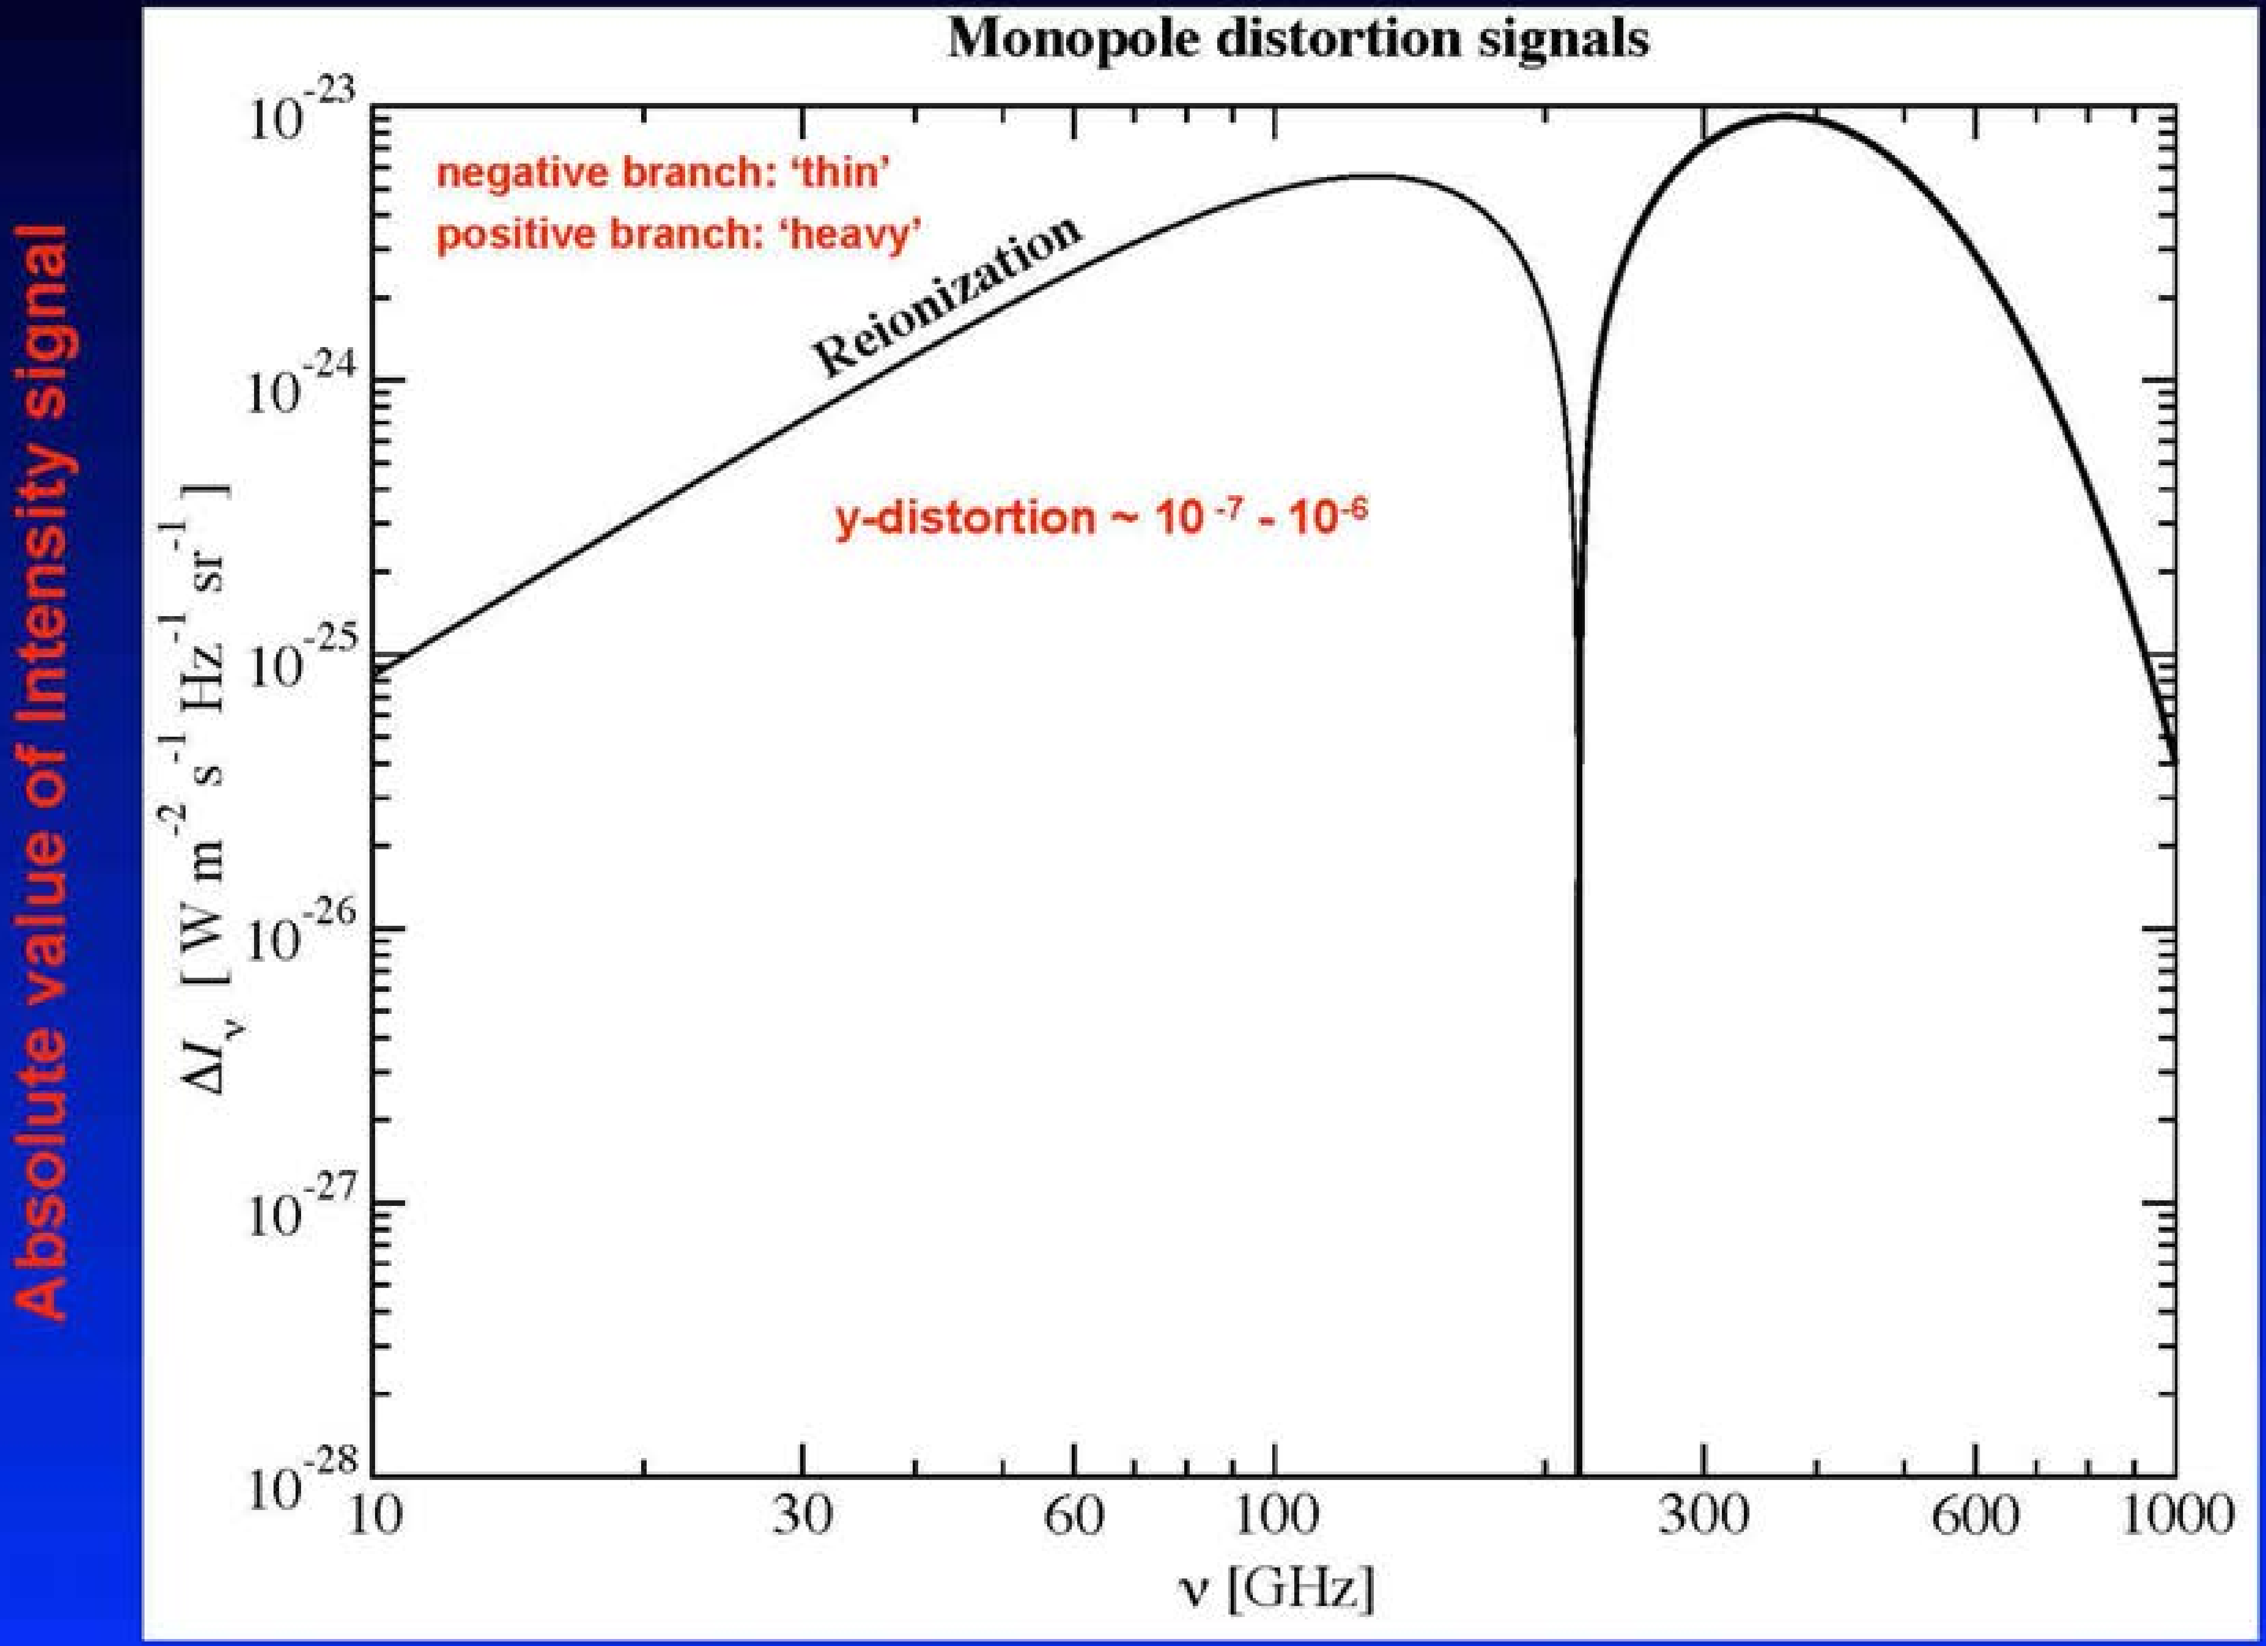


- Gas temperature T ≃ 10^4 K
- Thomson optical depth $\tau \simeq 0.1$

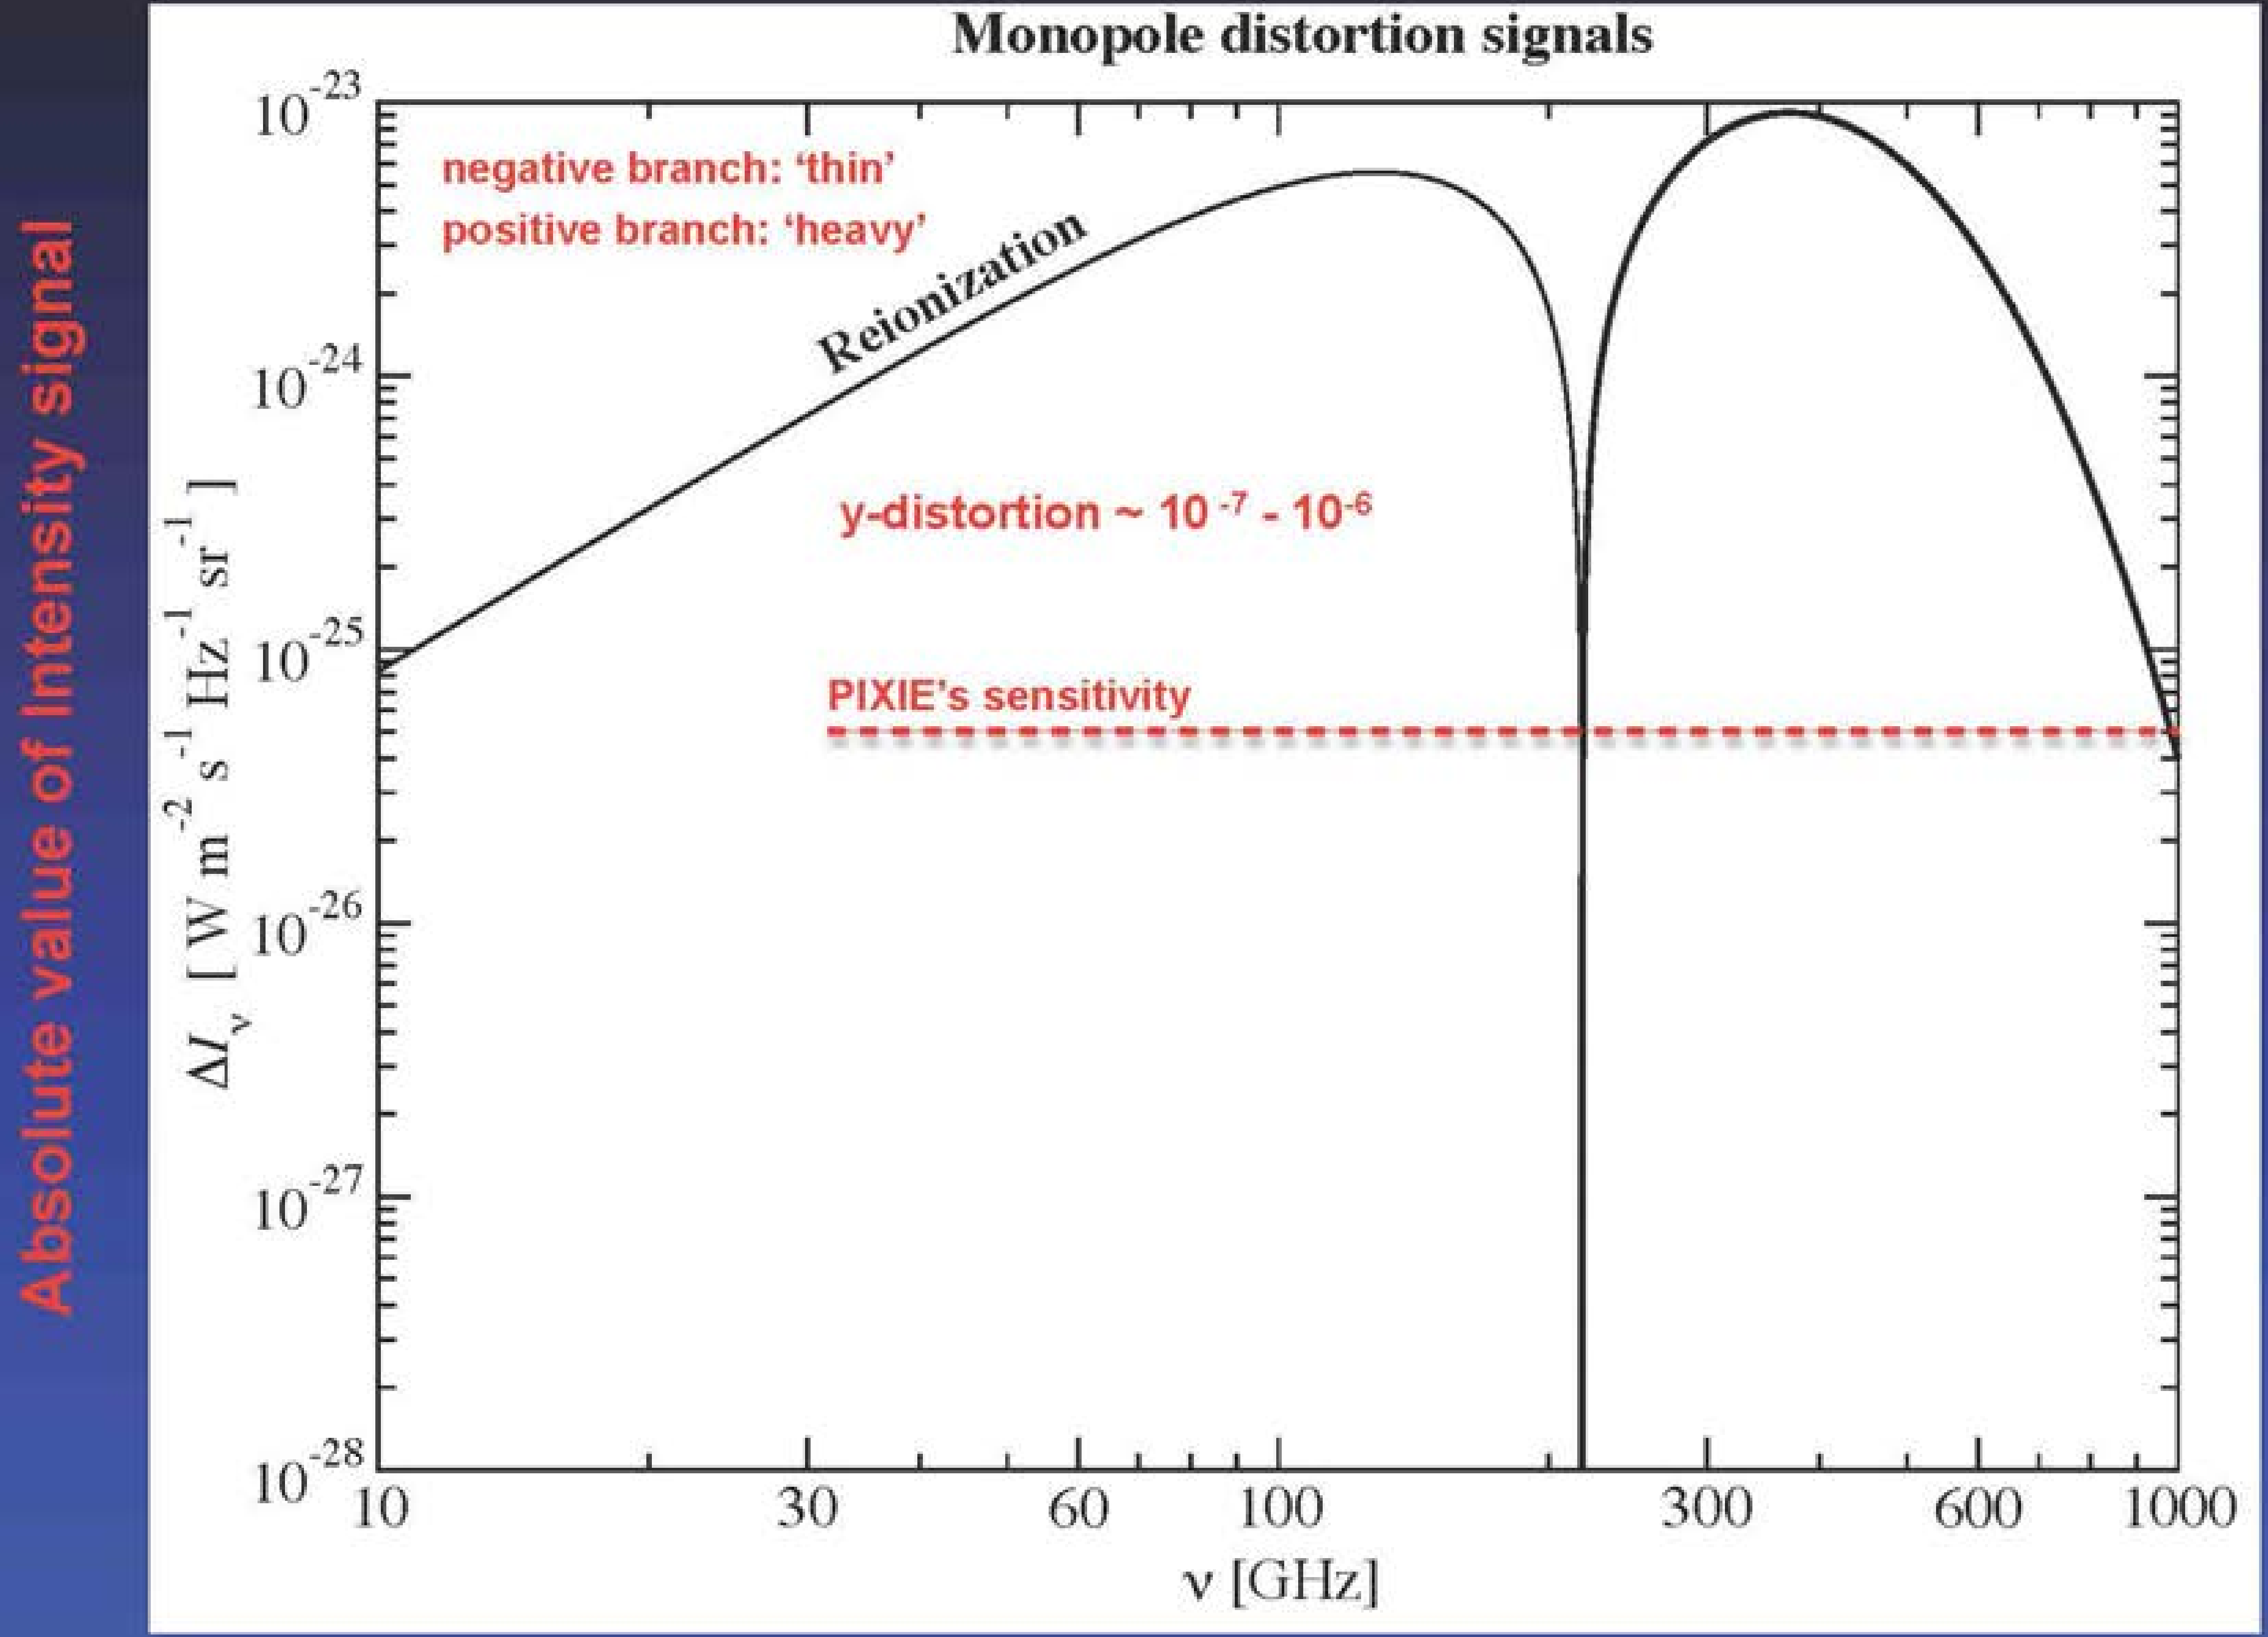
$$\Longrightarrow \quad y \simeq \frac{kT_e}{m_e c^2} \simeq 2 \times 10^{-7}$$

- second order Doppler effect $y \simeq$ few x 10^{-8}
- structure formation / SZ effect (e.g., Refregier et al., 2003) $y \simeq$ few x 10^{-7}-10^{-6}

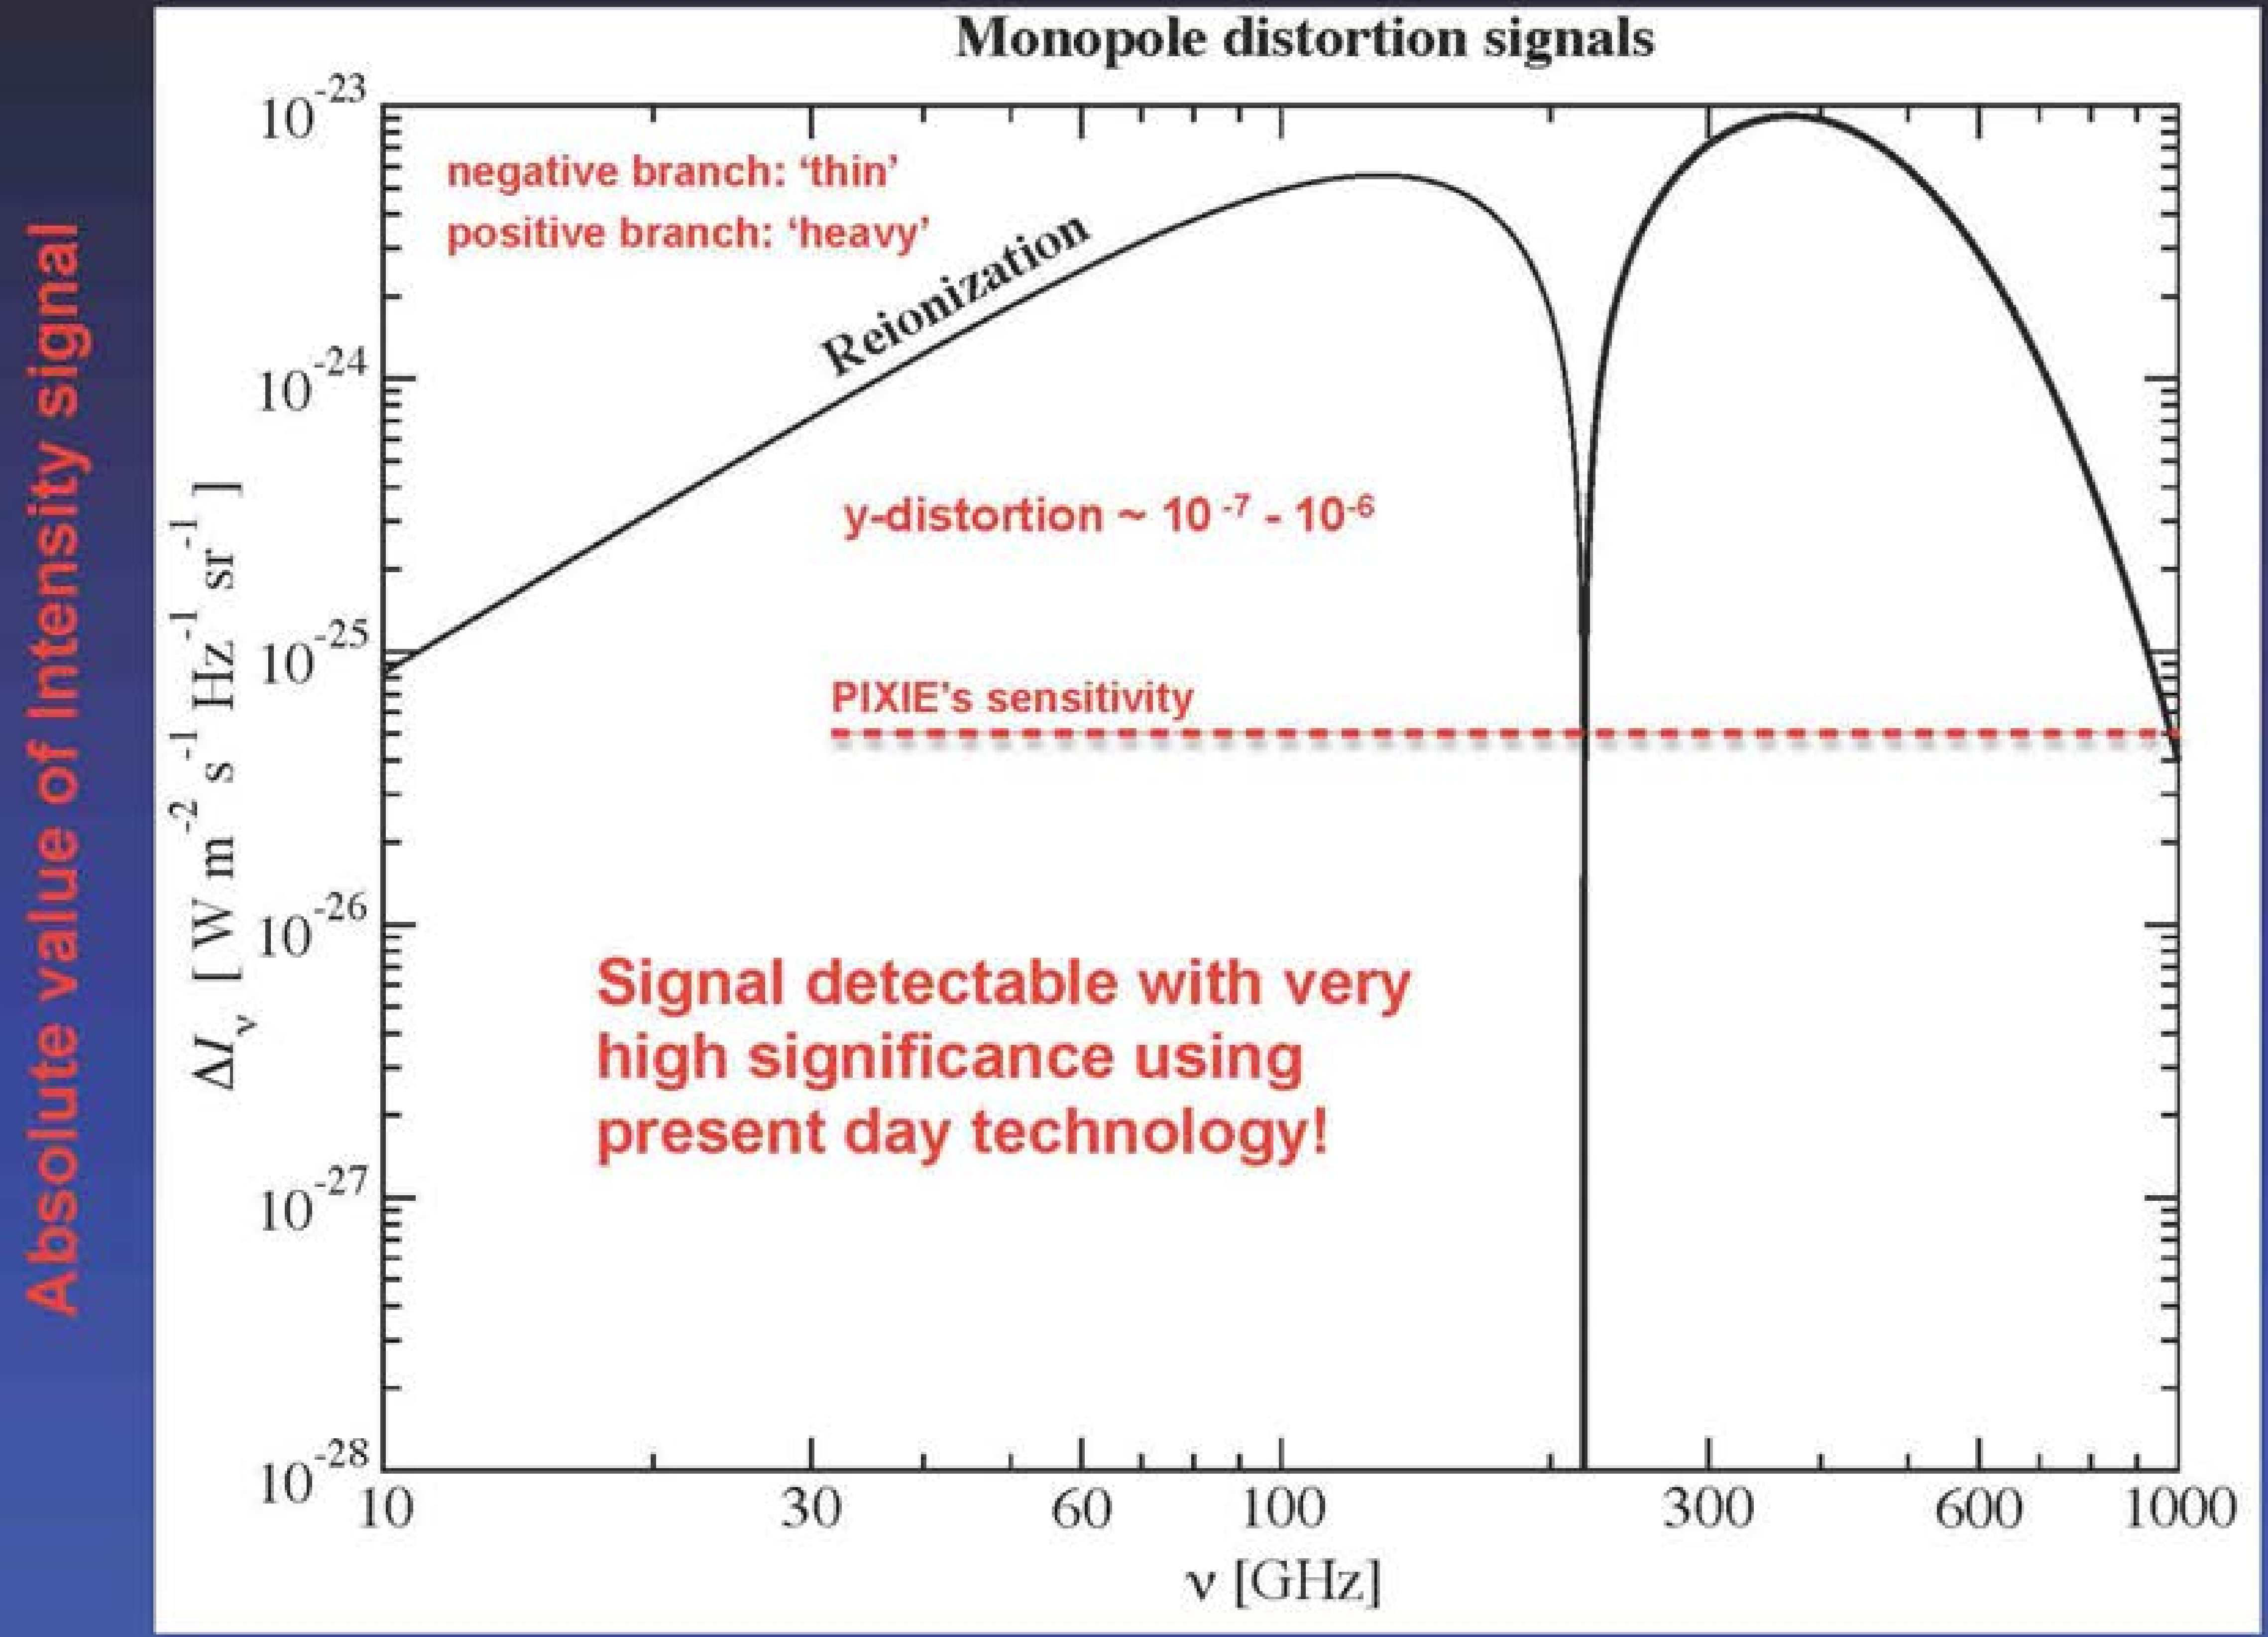
Average CMB spectral distortions



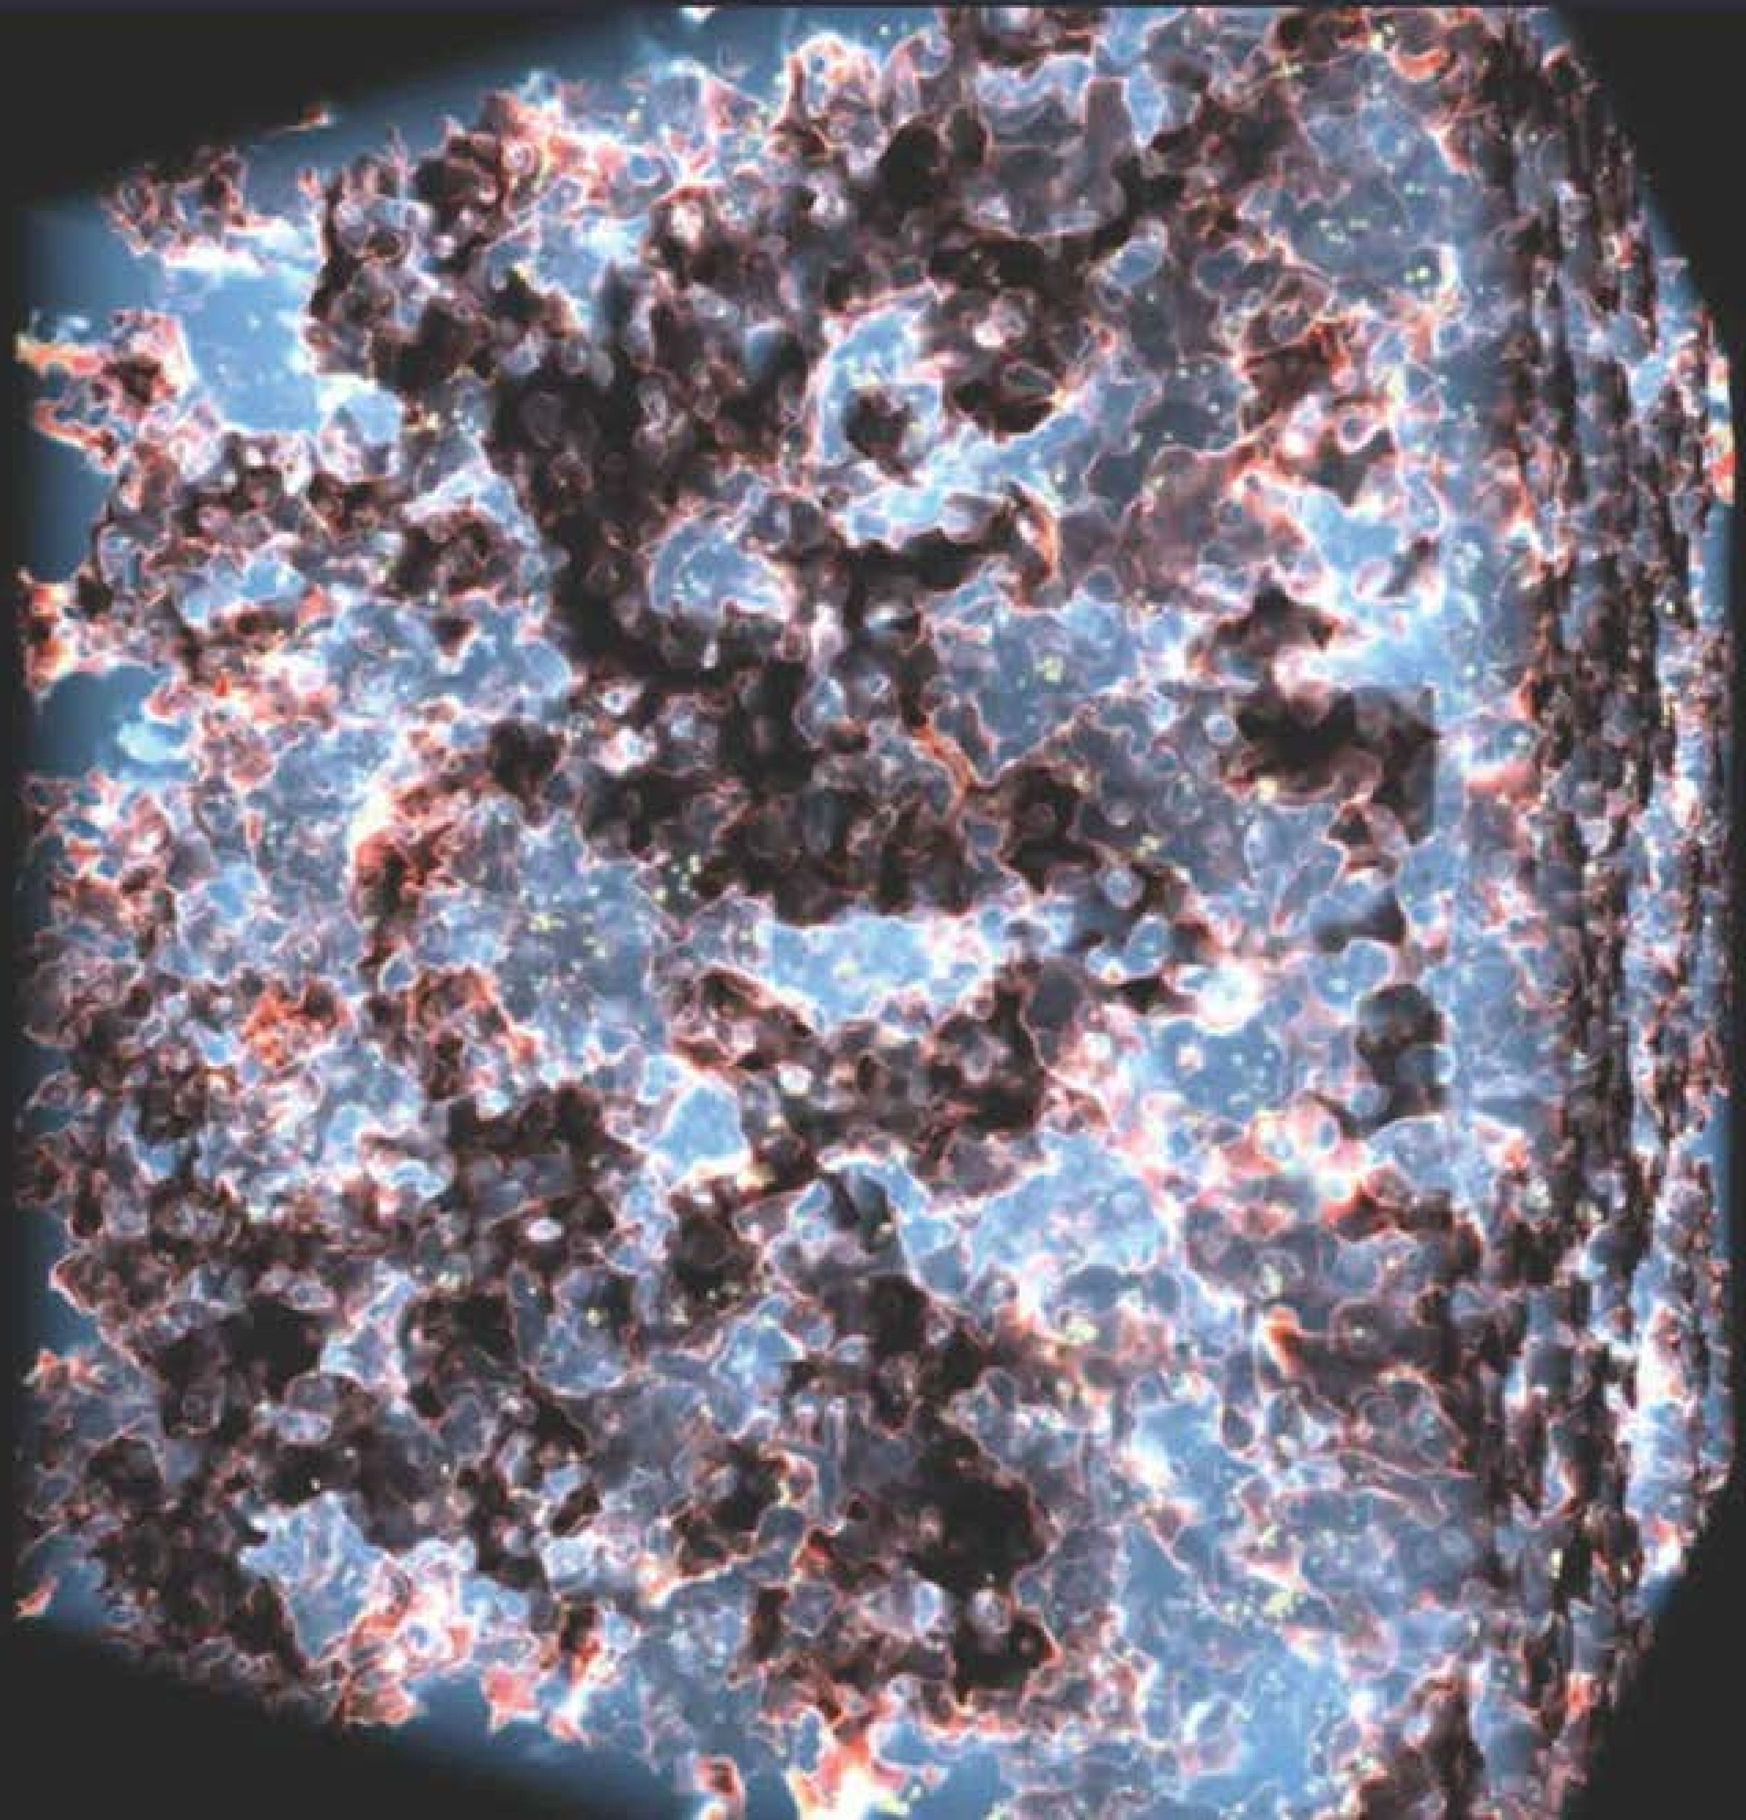
Average CMB spectral distortions



Average CMB spectral distortions



Fluctuations of the y-parameter at large scales



- spatial variations of the optical depth and temperature cause small-spatial variations of the y-parameter at different angular scales
- could tell us about the reionization sources and structure formation process
- additional independent piece of information!
- Cross-correlations with other signals

Example:
Simulation of reionization process (1Gpc/h) by *Alvarez & Abel*

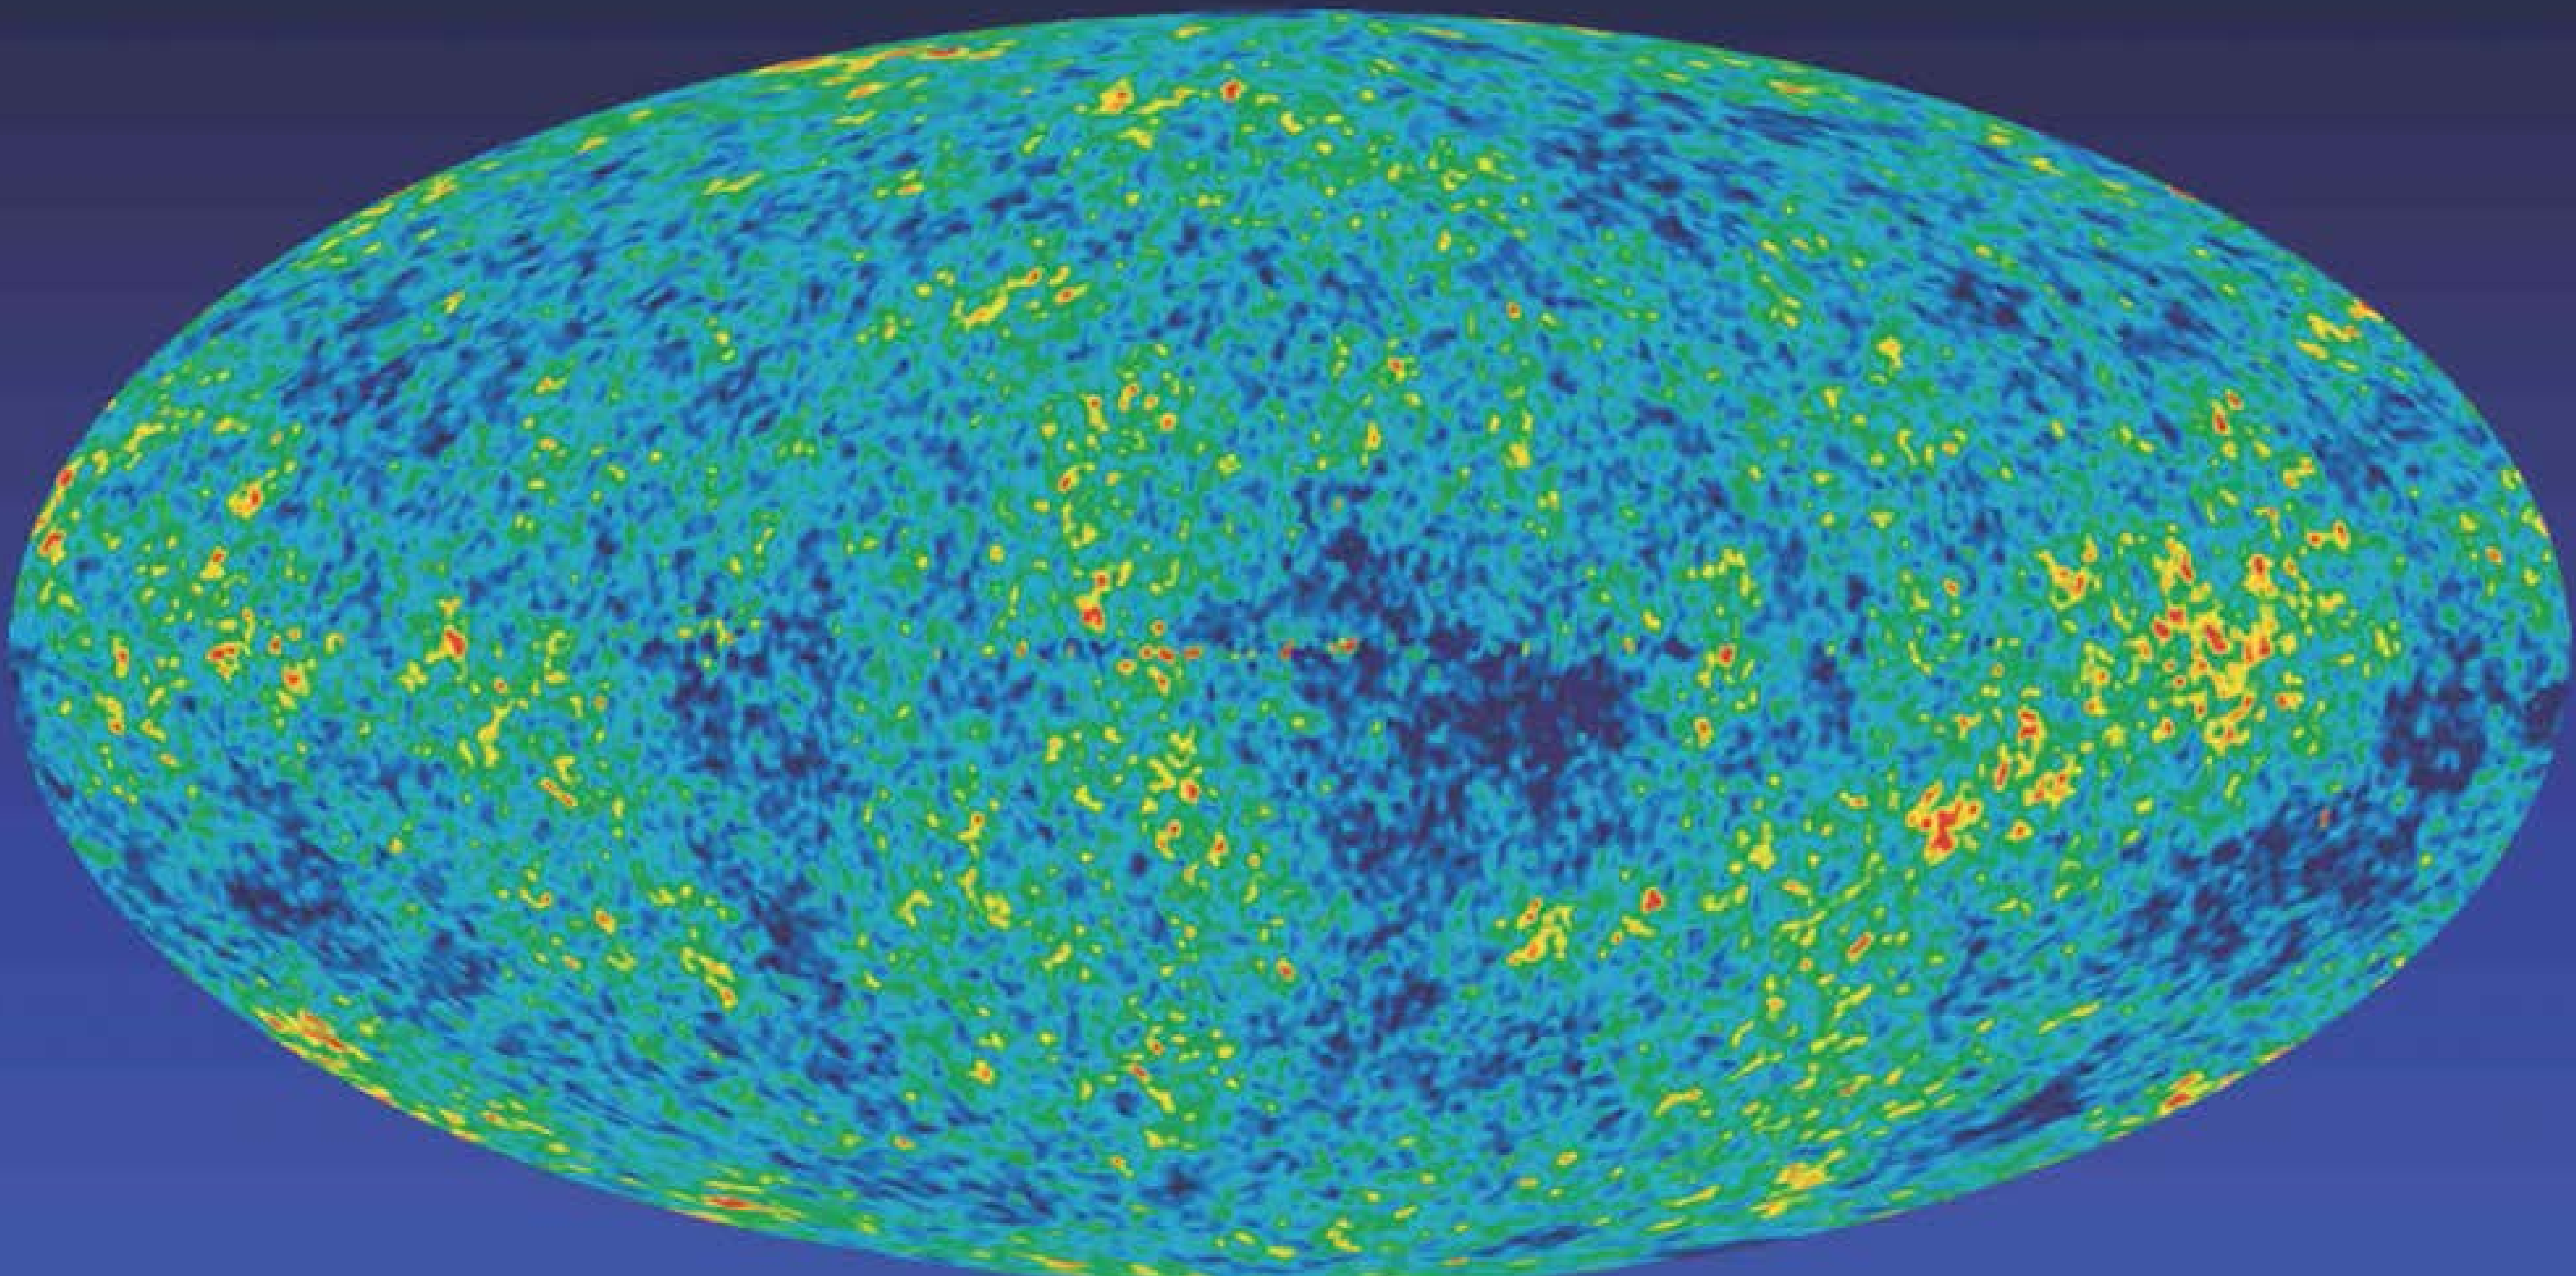
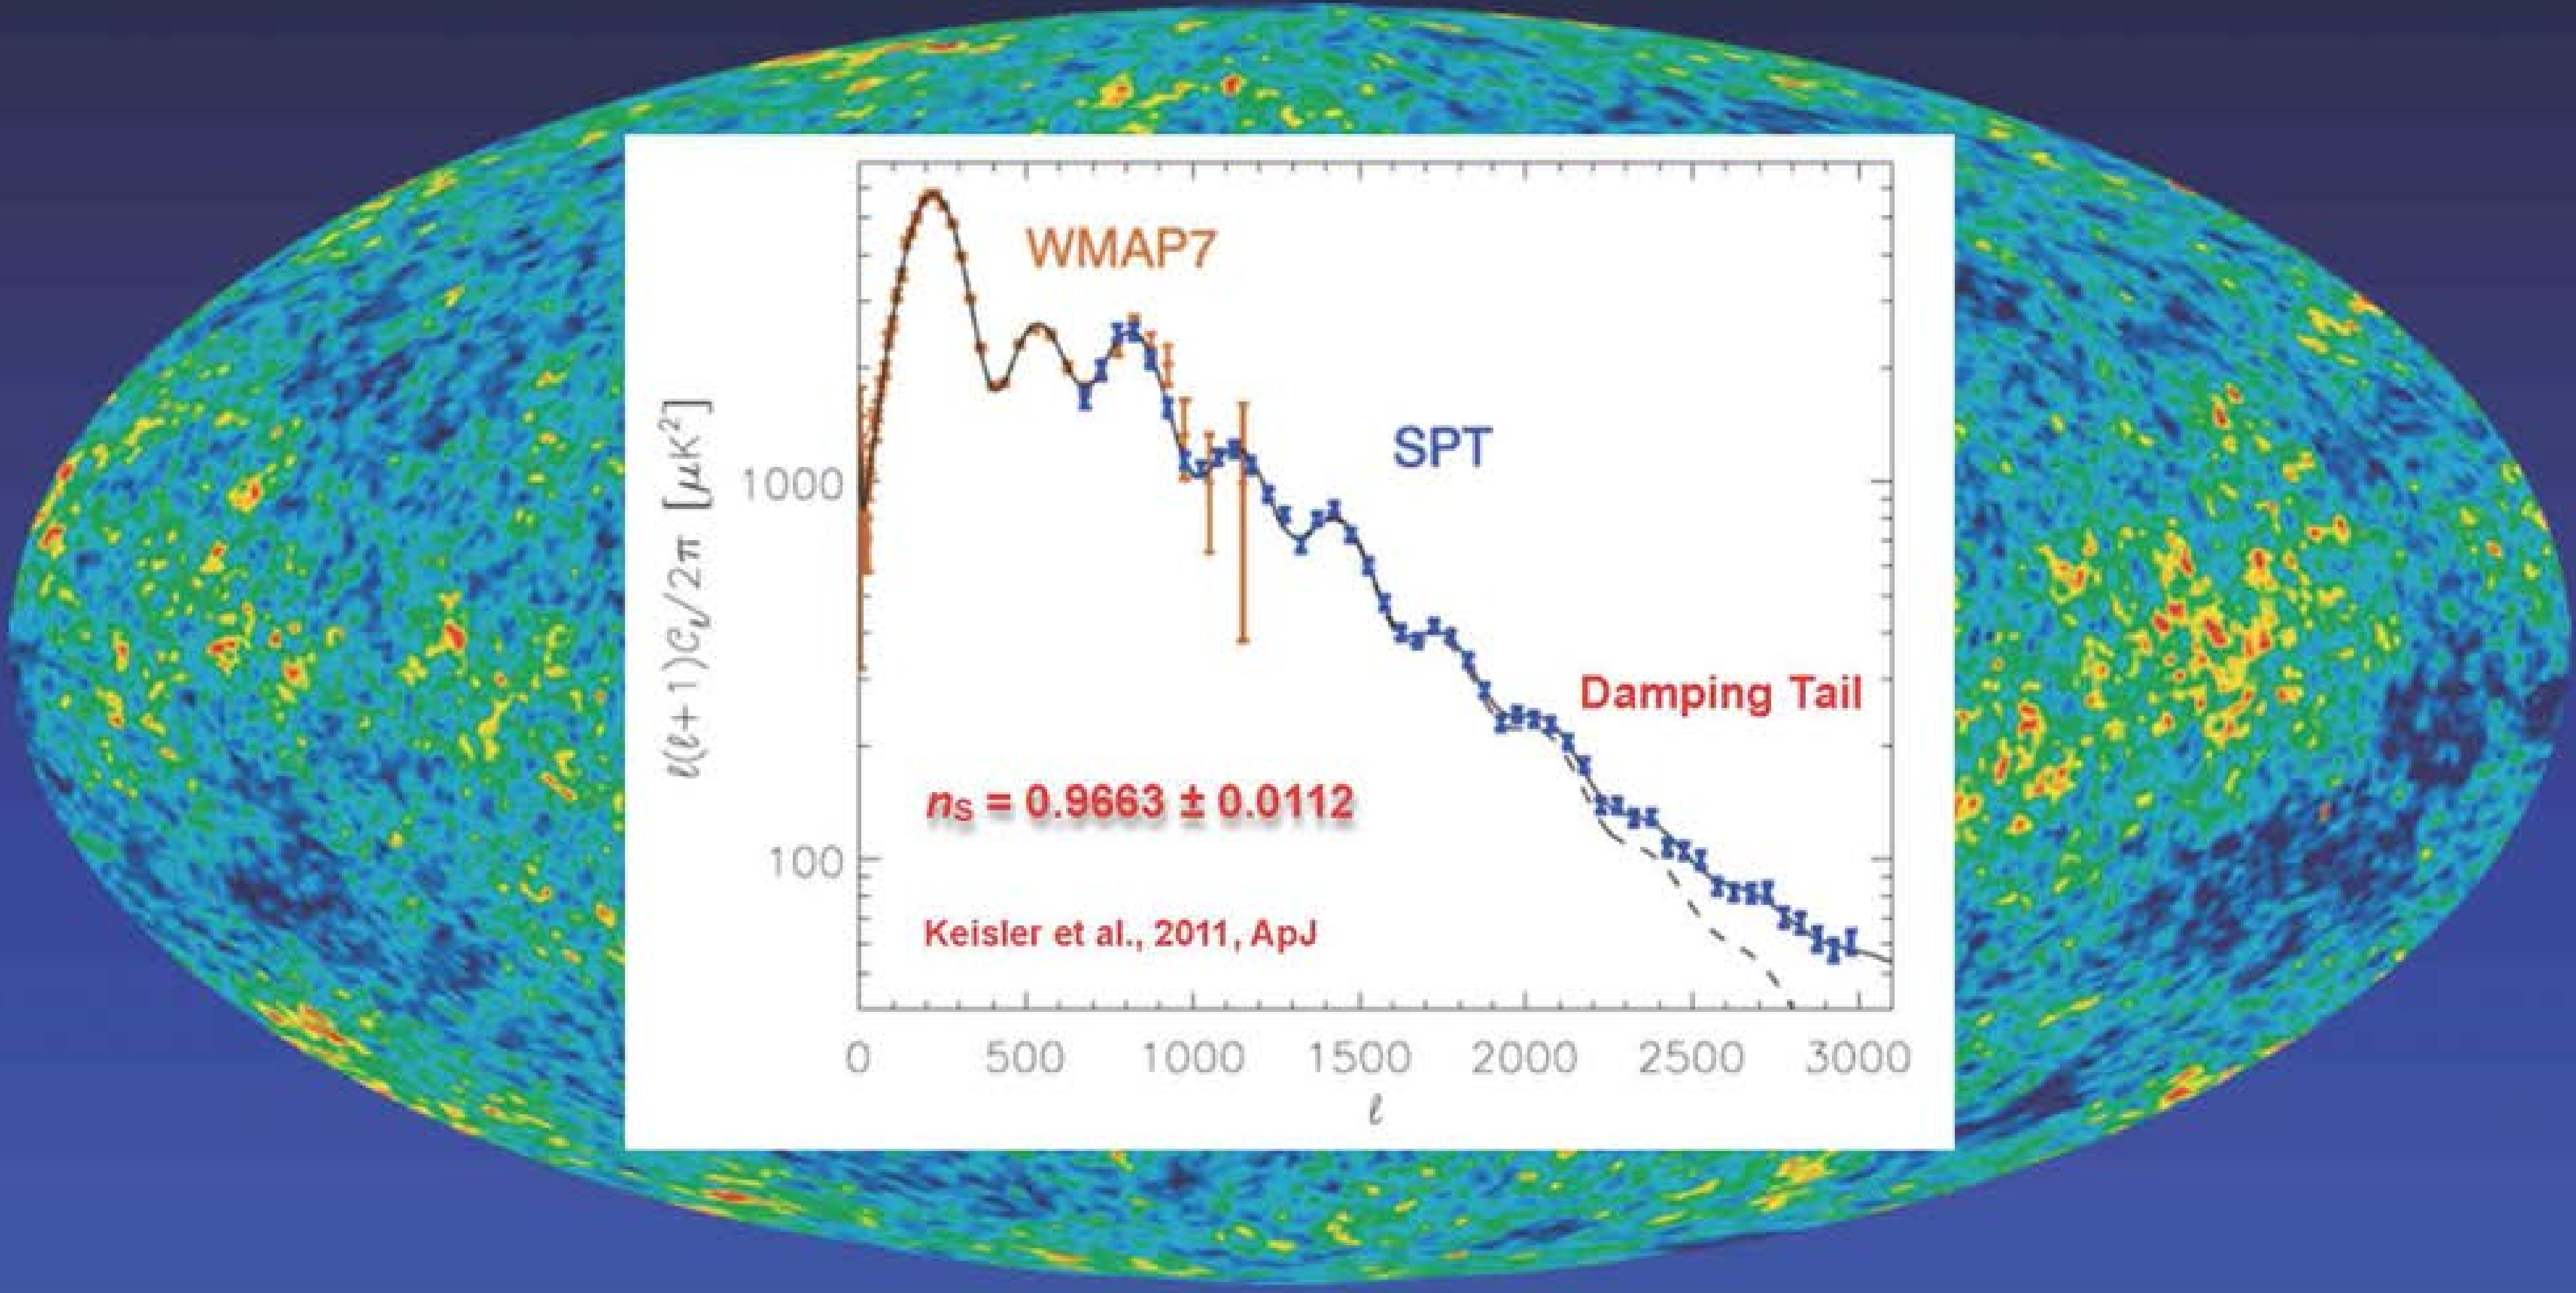
The dissipation of small-scale acoustic modes

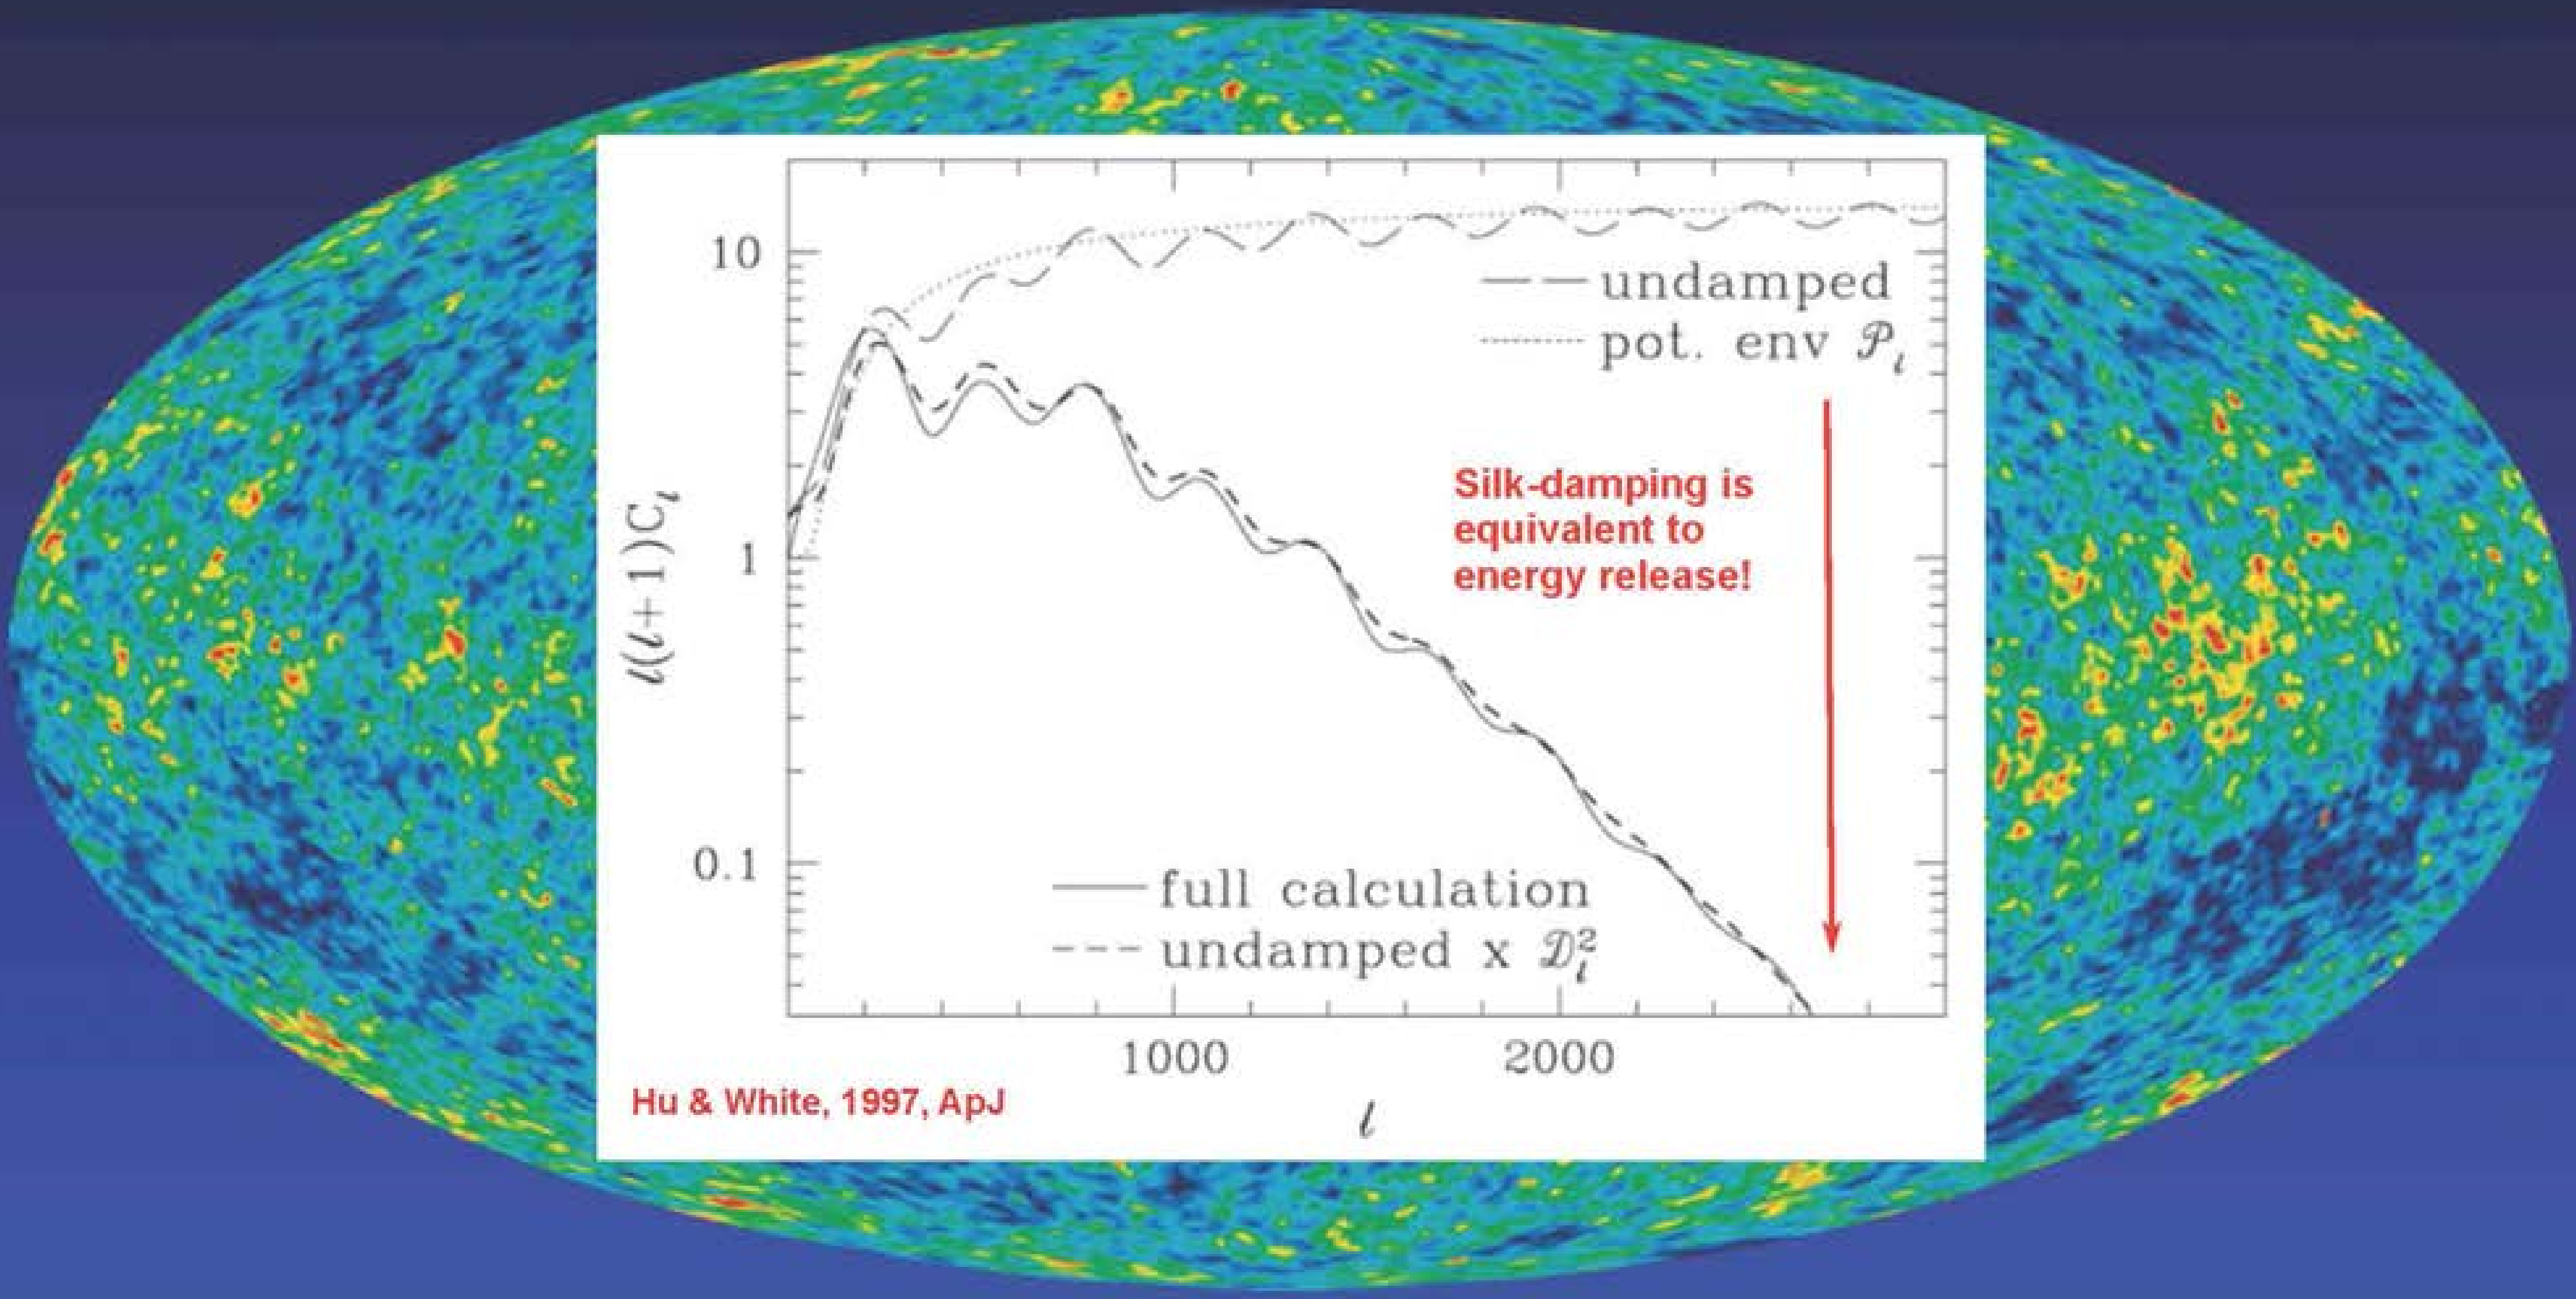
Dissipation of small-scale acoustic modes



Dissipation of small-scale acoustic modes



Dissipation of small-scale acoustic modes



Energy release caused by dissipation process

'Obvious' dependencies:

- *Amplitude* of the small-scale power spectrum
- *Shape* of the small-scale power spectrum
- *Dissipation scale* → $k_D \sim (H_0\, \Omega_{rel}^{1/2}\, N_{e,0})^{1/2}\, (1+z)^{3/2}$ at early times

not so 'obvious' dependencies:

- *primordial non-Gaussianity* in the squeezed limit
  (Pajer & Zaldarriaga, 2012; Ganc & Komatsu, 2012)
- *Type* of the perturbations (adiabatic ↔ isocurvature)
  (Barrow & Coles, 1991; Hu et al., 1994; Dent et al, 2012, JC & Grin, 2012)
- *Neutrinos* (or any extra relativistic degree of freedom)

Energy release caused by dissipation process

Dissipation of acoustic modes: 'microscopic picture'

E.g., our snapshot at z=0

- after inflation: photon field has spatially varying temperature T
- average energy stored in photon field at any given moment

$$\langle \rho_\gamma \rangle = a_R \langle T^4 \rangle \approx a_R \langle T \rangle^4 \,[1 + 4\underbrace{\langle \Theta \rangle}_{==0} + 6\langle \Theta^2 \rangle]$$

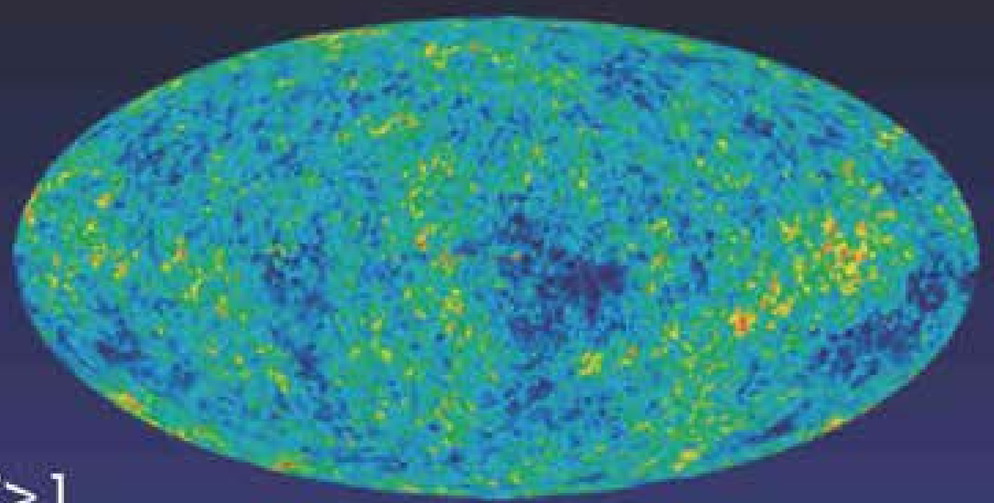
$$\Rightarrow \quad (a^4 \rho_\gamma)^{-1}\, \mathrm{d}a^4 Q_{ac}/\mathrm{d}t = -6\, \mathrm{d}\langle \Theta^2 \rangle/\mathrm{d}t$$

- Monopole actually drops out of the equation!
- In principle *all* higher multipoles contribute to the energy release

JC, Khatri & Sunyaev, 2012

Dissipation of acoustic modes: 'microscopic picture'

- after inflation: photon field has spatially varying temperature T
- average energy stored in photon field at any given moment



E.g., our snapshot at z=0

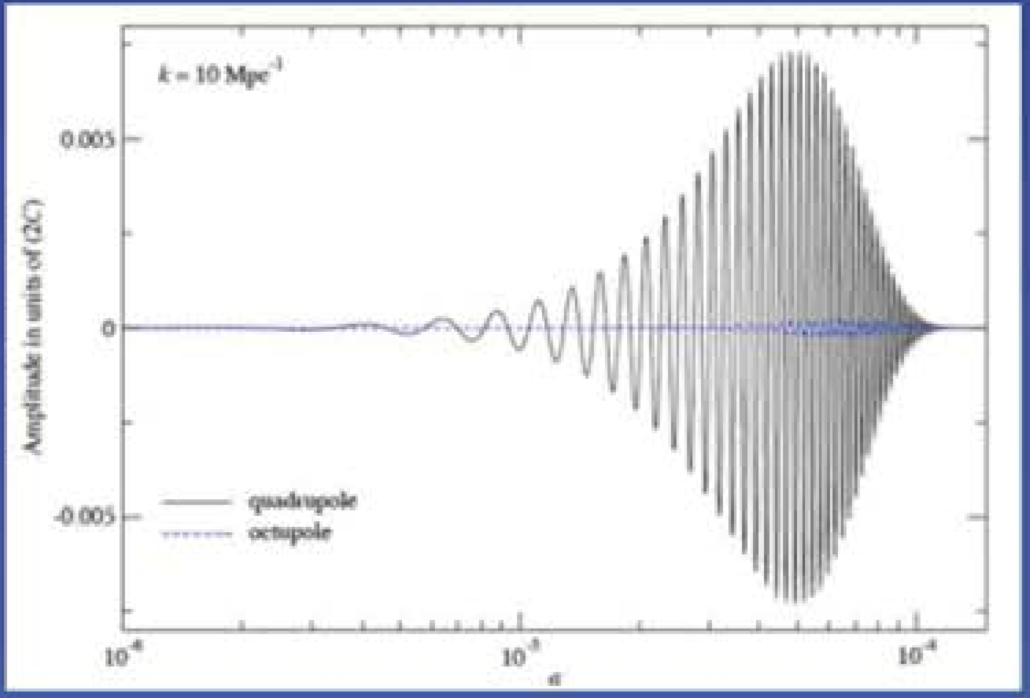
$$< \rho_\gamma > = a_R <T^4> \approx a_R <T>^4 [1+ \underbrace{4<\Theta>}_{== 0} + 6<\Theta^2>]$$

$$\Rightarrow \quad (a^4\rho_\gamma)^{-1} \, da^4 Q_{ac}/dt = -6 \, d<\Theta^2>/dt$$

- Monopole actually drops out of the equation!
- In principle *all* higher multipoles contribute to the energy release
- At high redshifts ($z \geq 10^4$):
  - *net (gauge-invariant) dipole and contributions from higher multipoles are negligible*
  - *dominant term caused by quadrupole anisotropy*

$$\Rightarrow \quad (a^4\rho_\gamma)^{-1} \, da^4 Q_{ac}/dt \approx -12 \, d<\Theta_0^2>/dt$$

9/4 larger than classical estimate



JC, Khatri & Sunyaev, 2012

Effective energy release caused by damping effect

- Effective heating rate from full 2x2 Boltzmann treatment **(JC, Khatri & Sunyaev, 2012)**

$$\frac{1}{a^4\rho_\gamma}\frac{\mathrm{d}a^4Q_{\rm ac}}{\mathrm{d}t} = 4\sigma_{\rm T}N_{\rm e}c\left\langle \frac{(3\Theta_1-\beta)^2}{3} + \frac{9}{2}\Theta_2^2 - \frac{1}{2}\Theta_2(\Theta_0^{\rm P}+\Theta_2^{\rm P}) + \sum_{l\geq 3}(2l+1)\Theta_\ell^2 \right\rangle$$

$$\Theta_\ell = \frac{1}{2}\int \Theta(\mu)P_\ell(\mu)\mathrm{d}\mu$$

gauge-independent dipole **effect of polarization** **higher multipoles**

$$\langle XY\rangle = \int \frac{k^2\mathrm{d}k}{2\pi^2}P(k)X(k)Y(k)$$

Primordial power spectrum

Effective energy release caused by damping effect

- Effective heating rate from full 2x2 Boltzmann treatment **(JC, Khatri & Sunyaev, 2012)**

$$\frac{1}{a^4\rho_\gamma}\frac{\mathrm{d}a^4 Q_{\rm ac}}{\mathrm{d}t} = 4\sigma_{\rm T} N_{\rm e} c \left\langle \frac{(3\Theta_1-\beta)^2}{3} + \frac{9}{2}\Theta_2^2 - \frac{1}{2}\Theta_2(\Theta_0^{\rm P}+\Theta_2^{\rm P}) + \sum_{l\geq 3}(2l+1)\Theta_\ell^2 \right\rangle$$

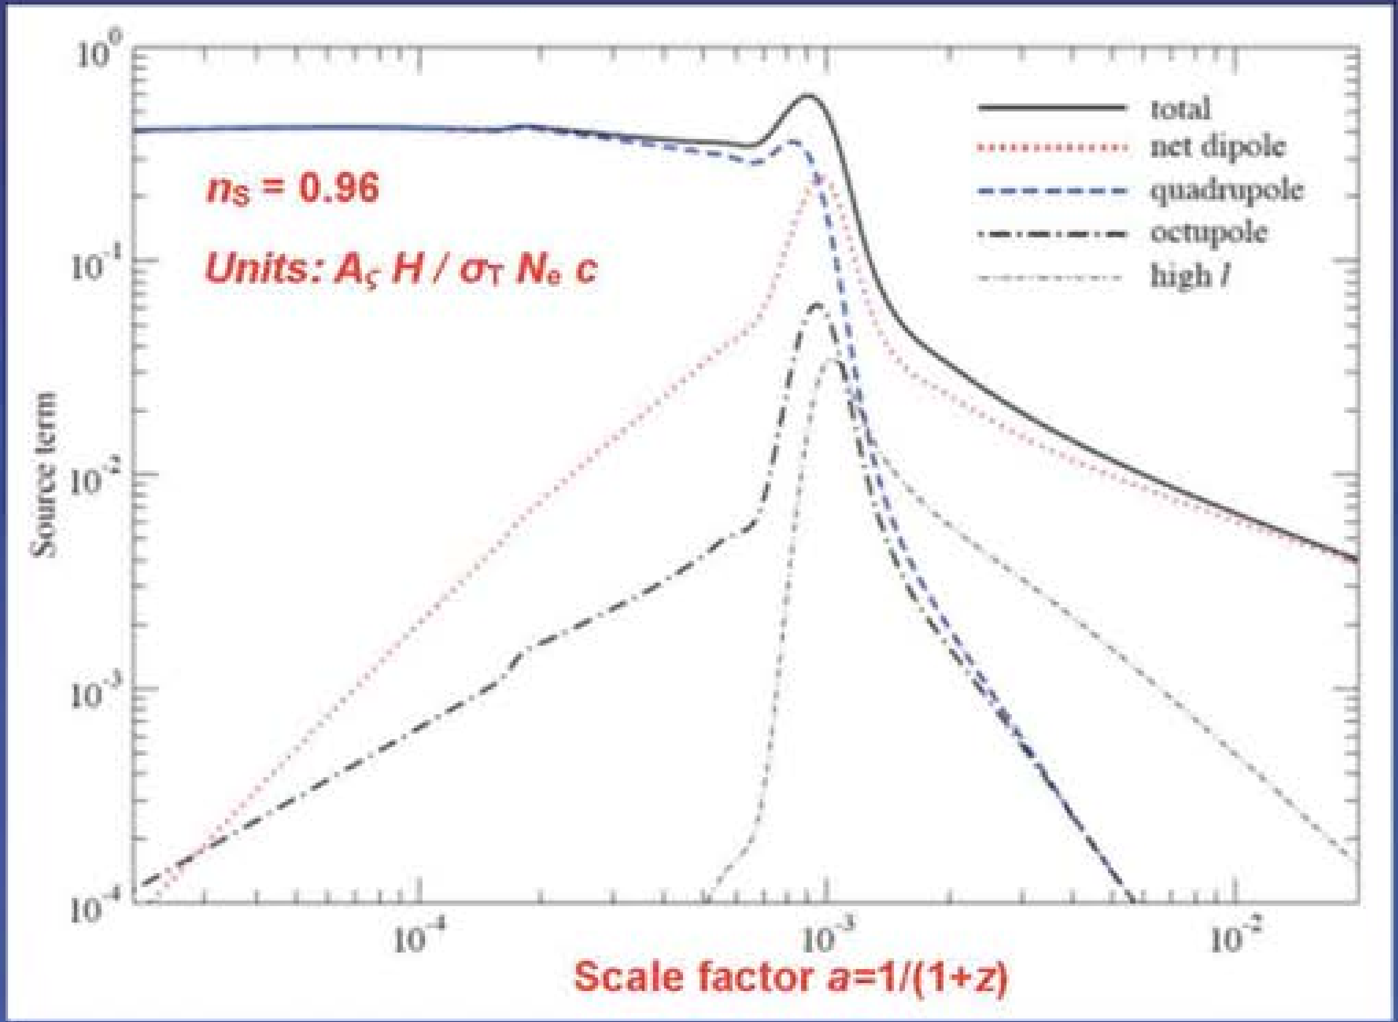
$$\Theta_\ell = \frac{1}{2}\int \Theta(\mu) P_\ell(\mu)\,\mathrm{d}\mu$$

gauge-independent dipole — **effect of polarization** — **higher multipoles**

$$\langle XY\rangle = \int \frac{k^2\mathrm{d}k}{2\pi^2} P(k) X(k) Y(k)$$

Primordial power spectrum

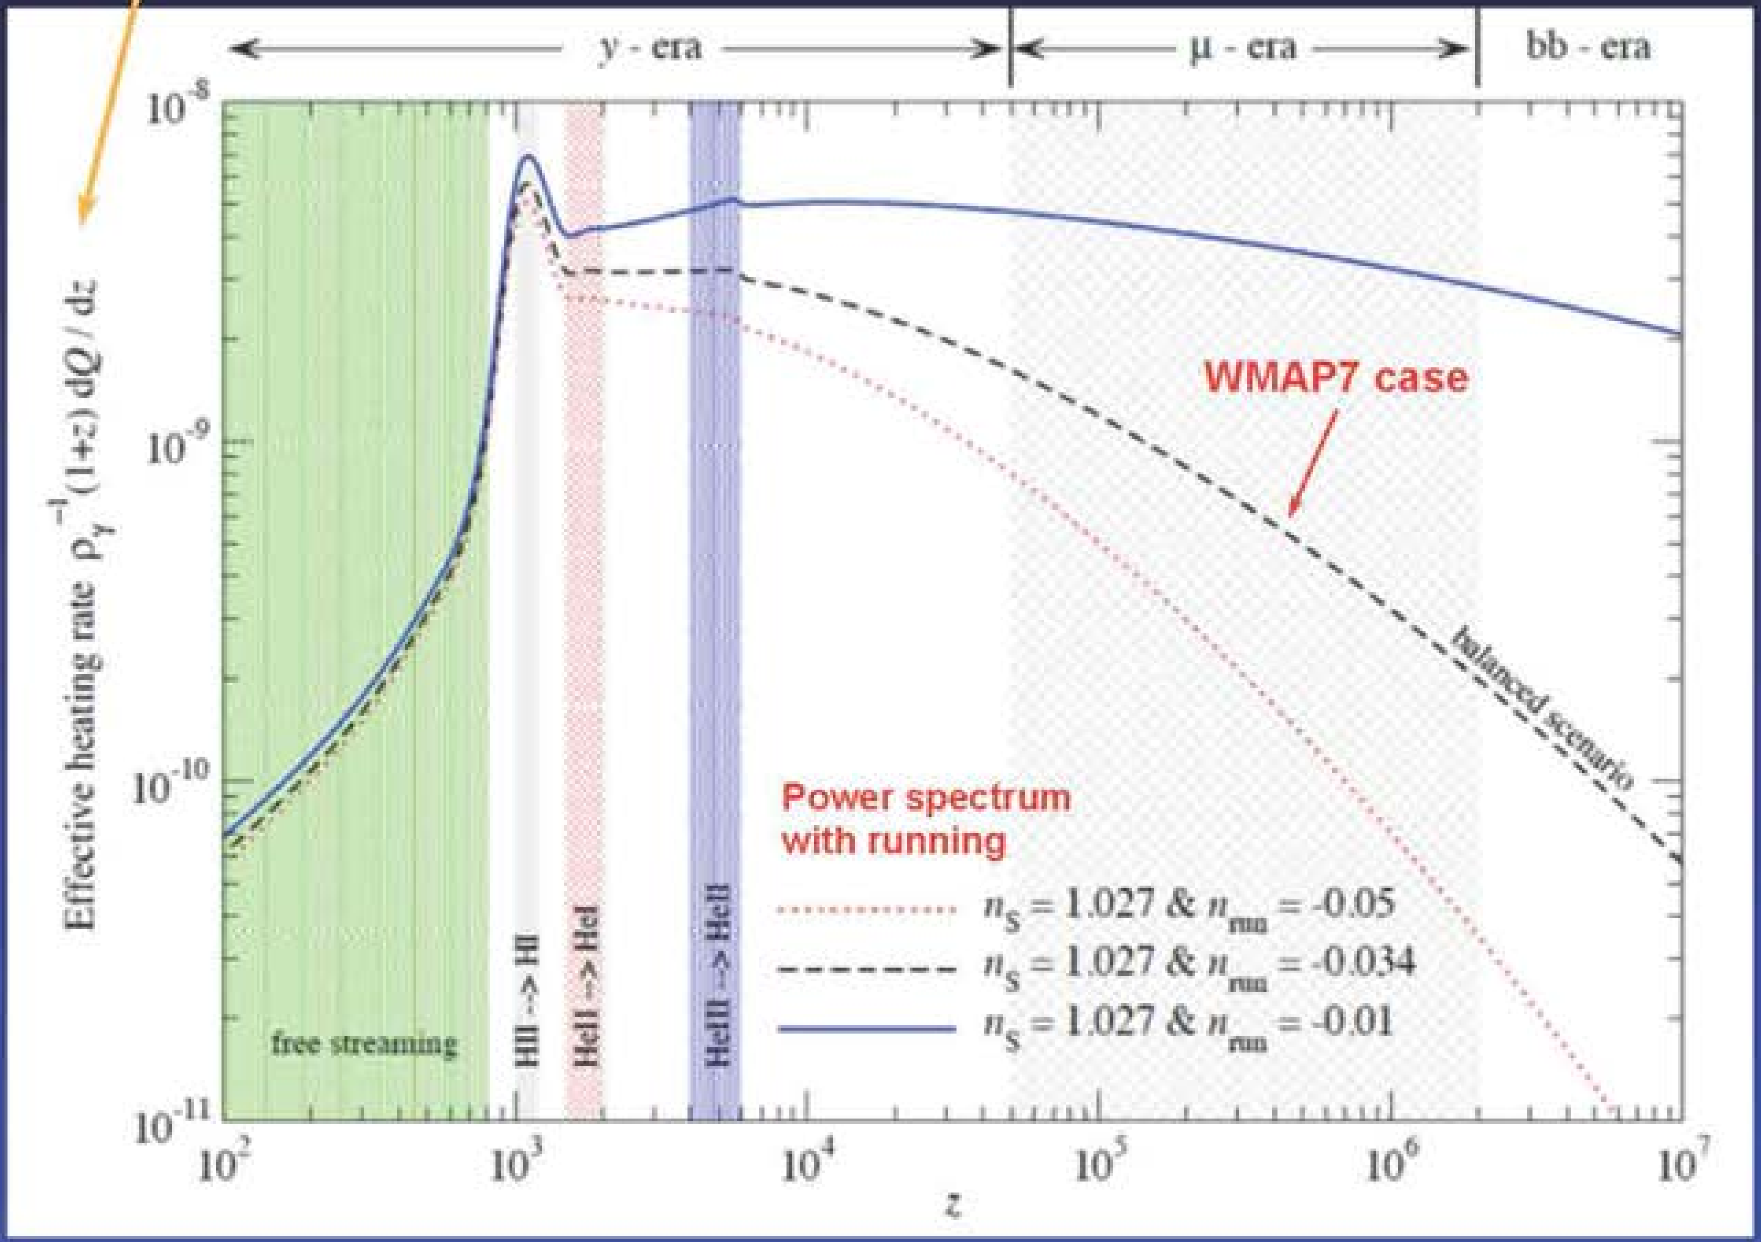
- *quadrupole* dominant at high z
- *net dipole* important only at low redshifts
- polarization ~5% effect
- contribution from higher multipoles rather small



JC, Khatri & Sunyaev, 2012

Our computation for the effective energy release

scaled such that constant for $n_S = 1$



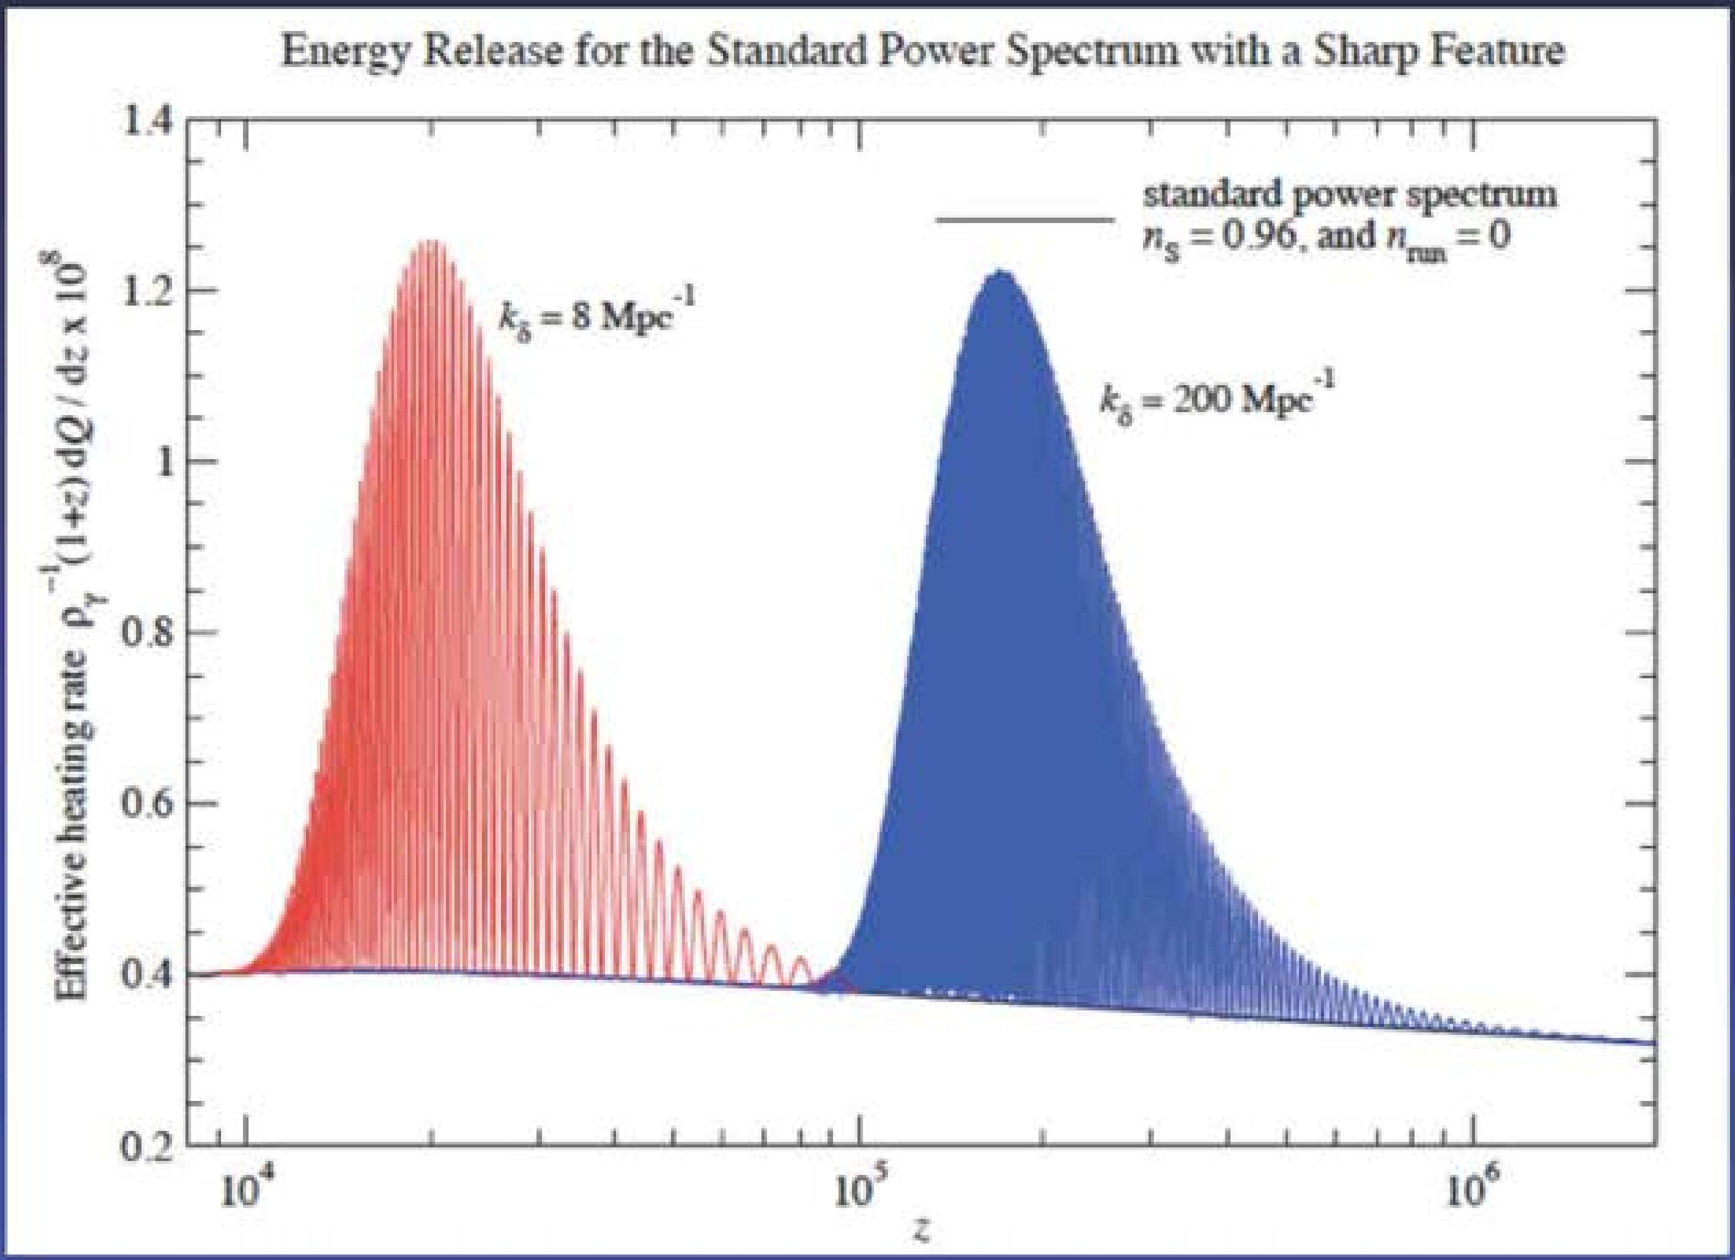
JC, Khatri & Sunyaev, 2012

- Our 2. order perturbation calculation showed that the *classical* picture was slightly inconsistent
- Amplitude of the distortion depends on the small-scale power spectrum
- **Computation carried out with *CosmoTherm***
  (JC & Sunyaev 2011)

$$P_\zeta(k) = 2\pi^2 A_\zeta k^{-3} (k/k_0)^{n_S - 1 + \frac{1}{2} n_{\rm run} \ln(k/k_0)}$$

Primordial power spectrum of curvature perturbations is input for the calculation

Which modes dissipate in the μ and y-eras?



- Single mode with wavenumber k dissipates its energy at

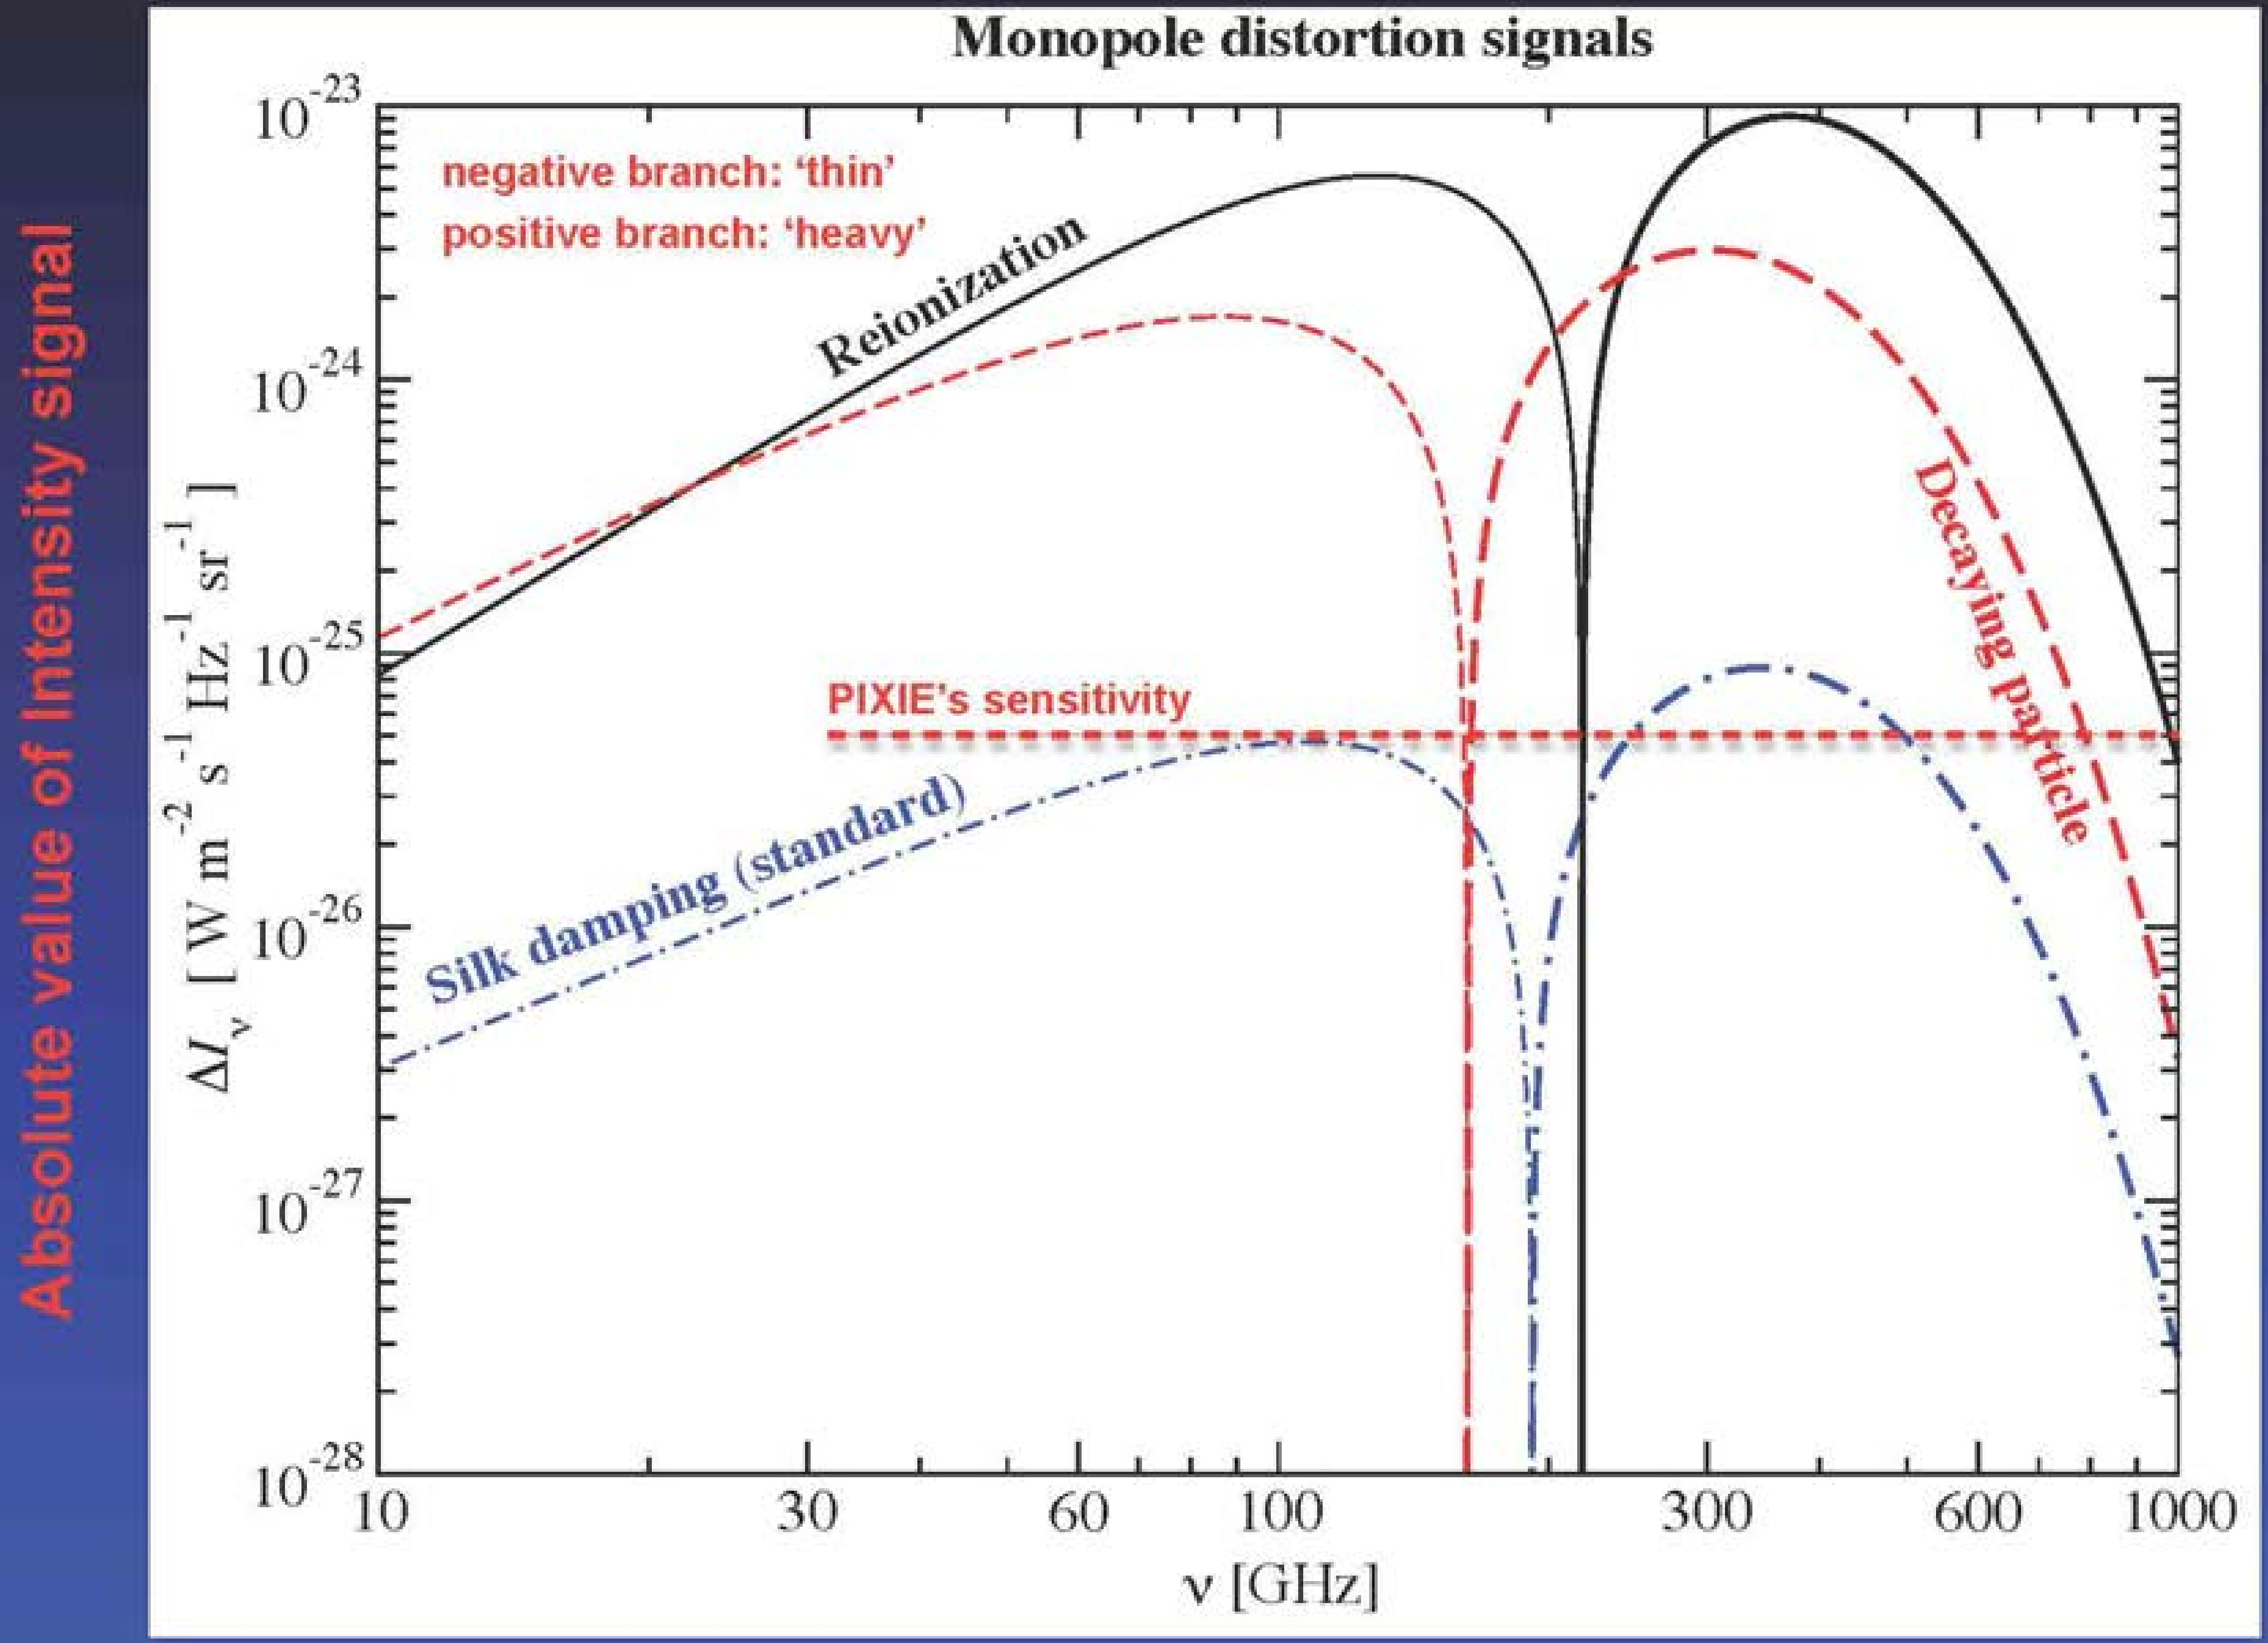
  $z_d \sim 4.5\times10^5(k\,\mathrm{Mpc}/10^3)^{2/3}$

- Modes with wavenumber $50\ \mathrm{Mpc}^{-1} < k < 10^4\ \mathrm{Mpc}^{-1}$ dissipate their energy during the μ-era

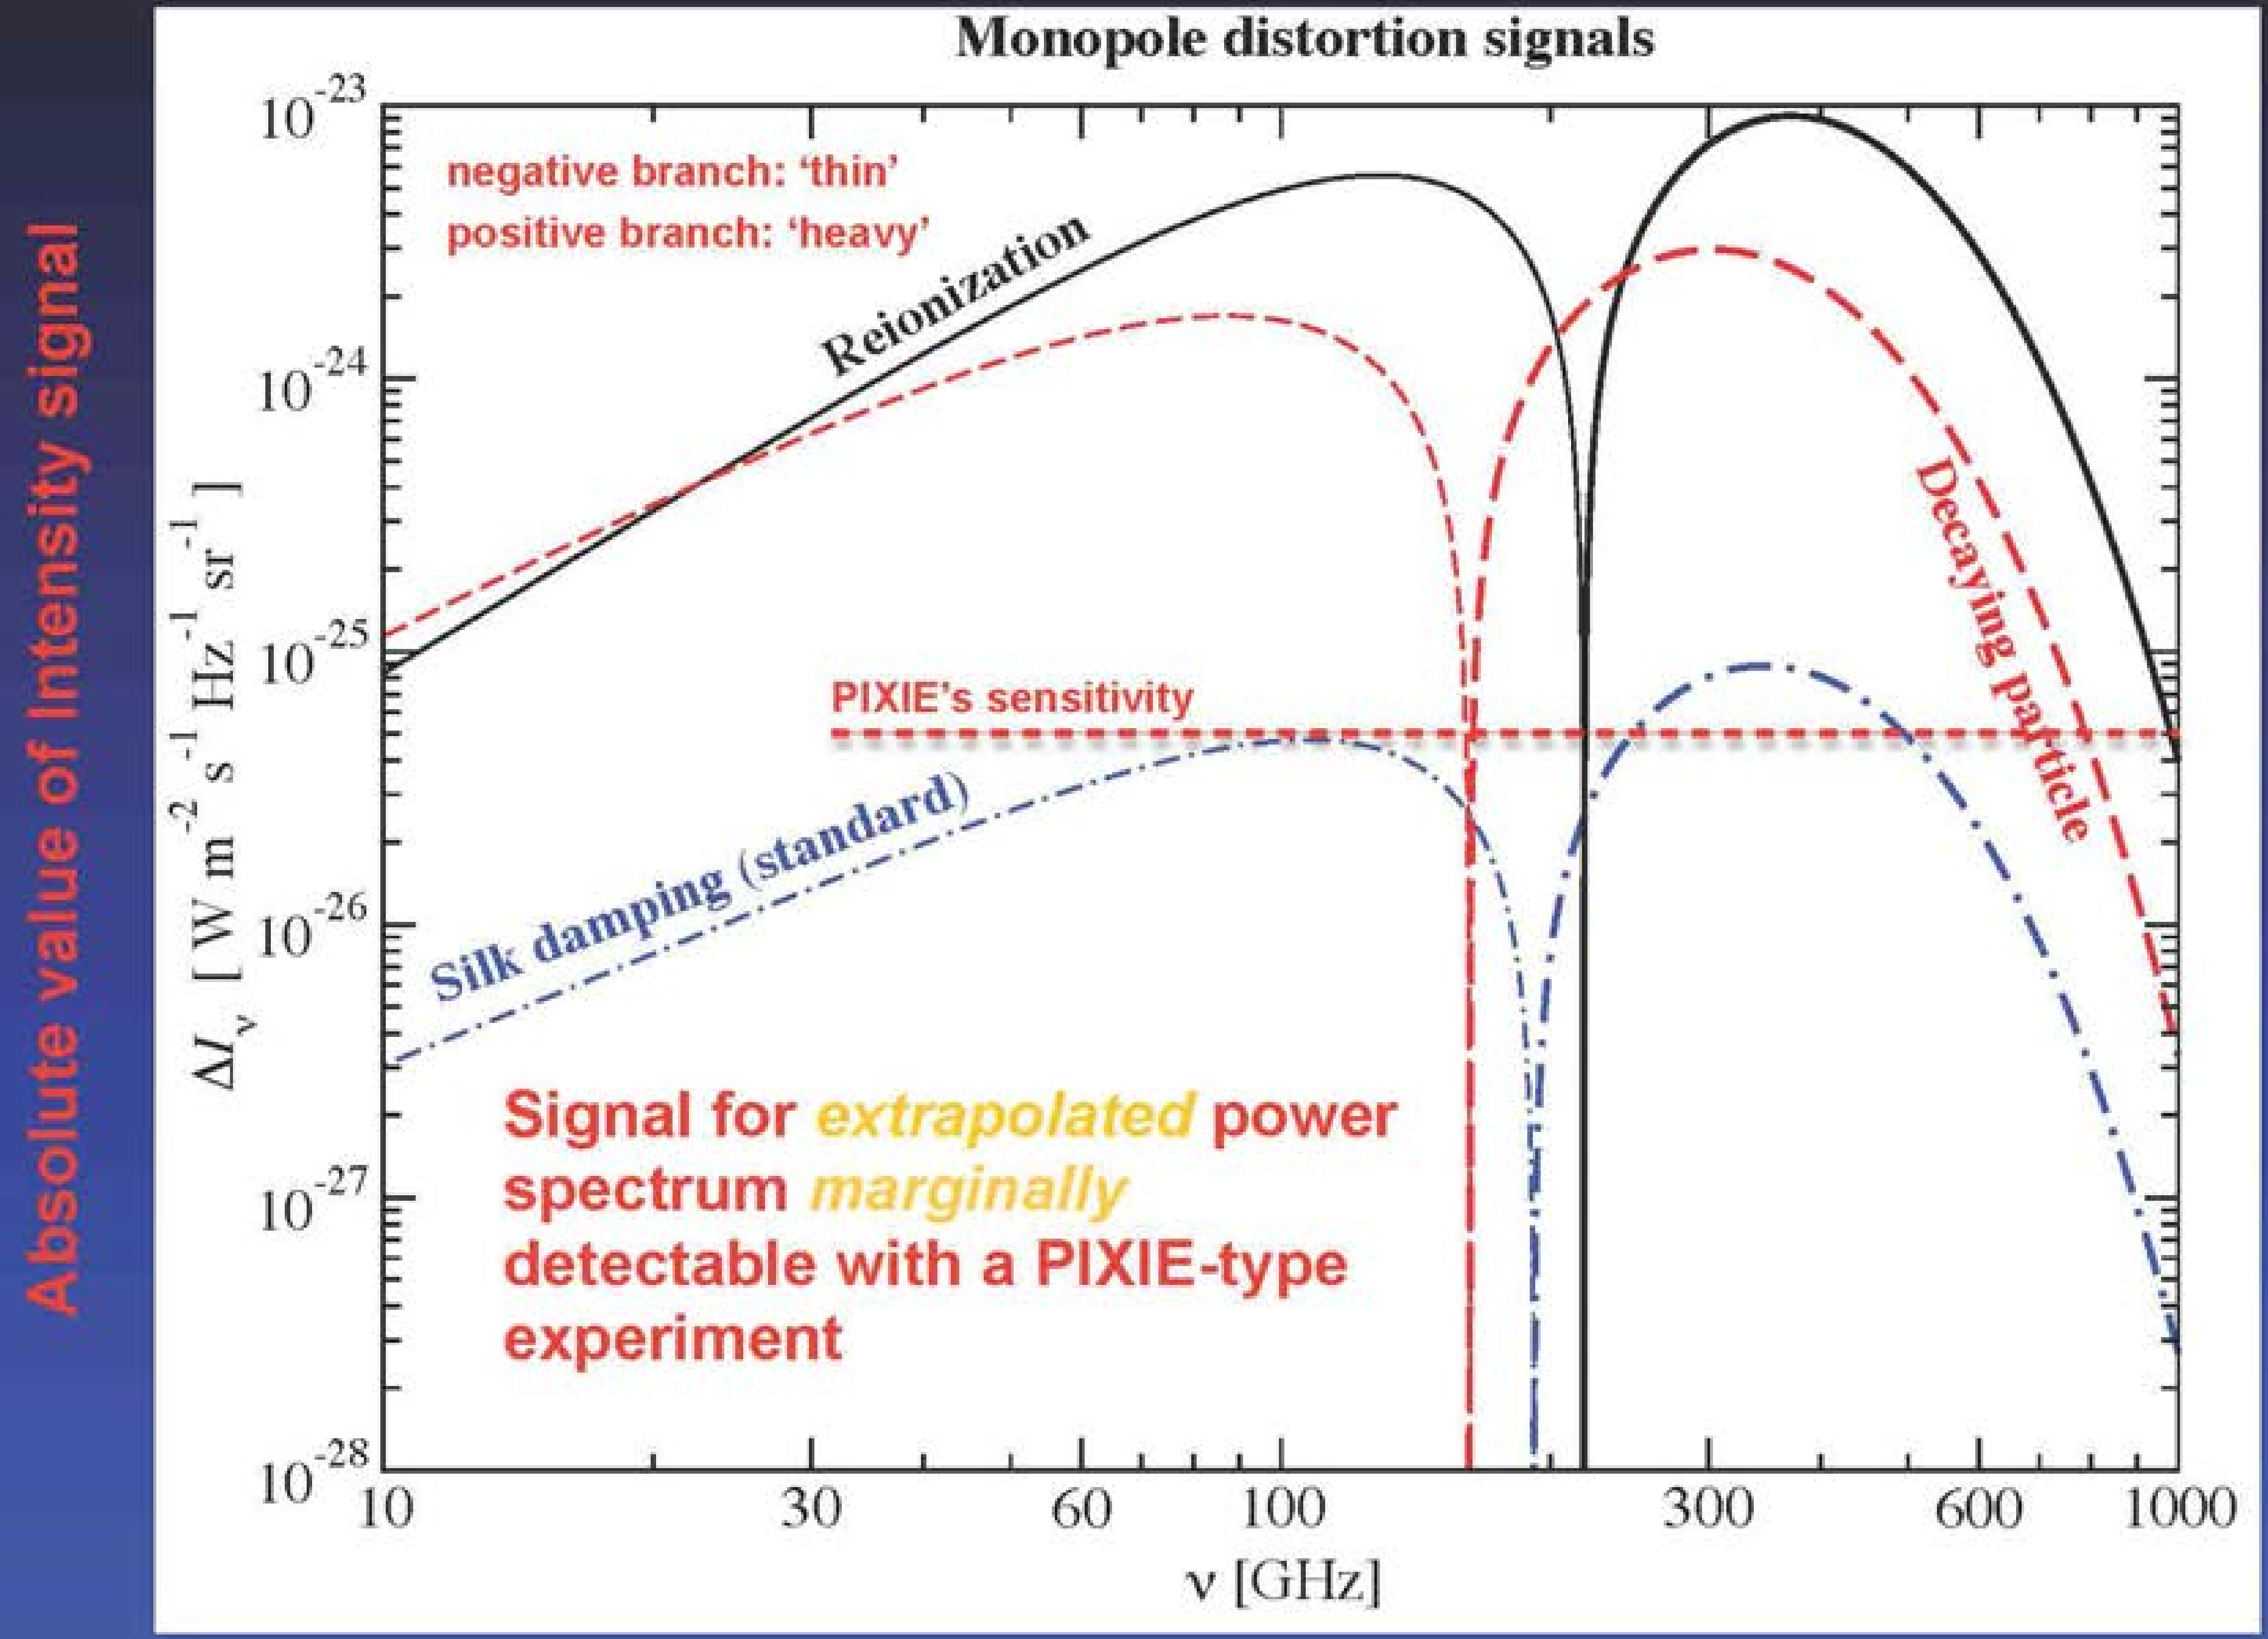
- Modes with $k < 50\ \mathrm{Mpc}^{-1}$ cause y-distortion

JC, Erickcek & Ben-Dayan, 2012

Average CMB spectral distortions

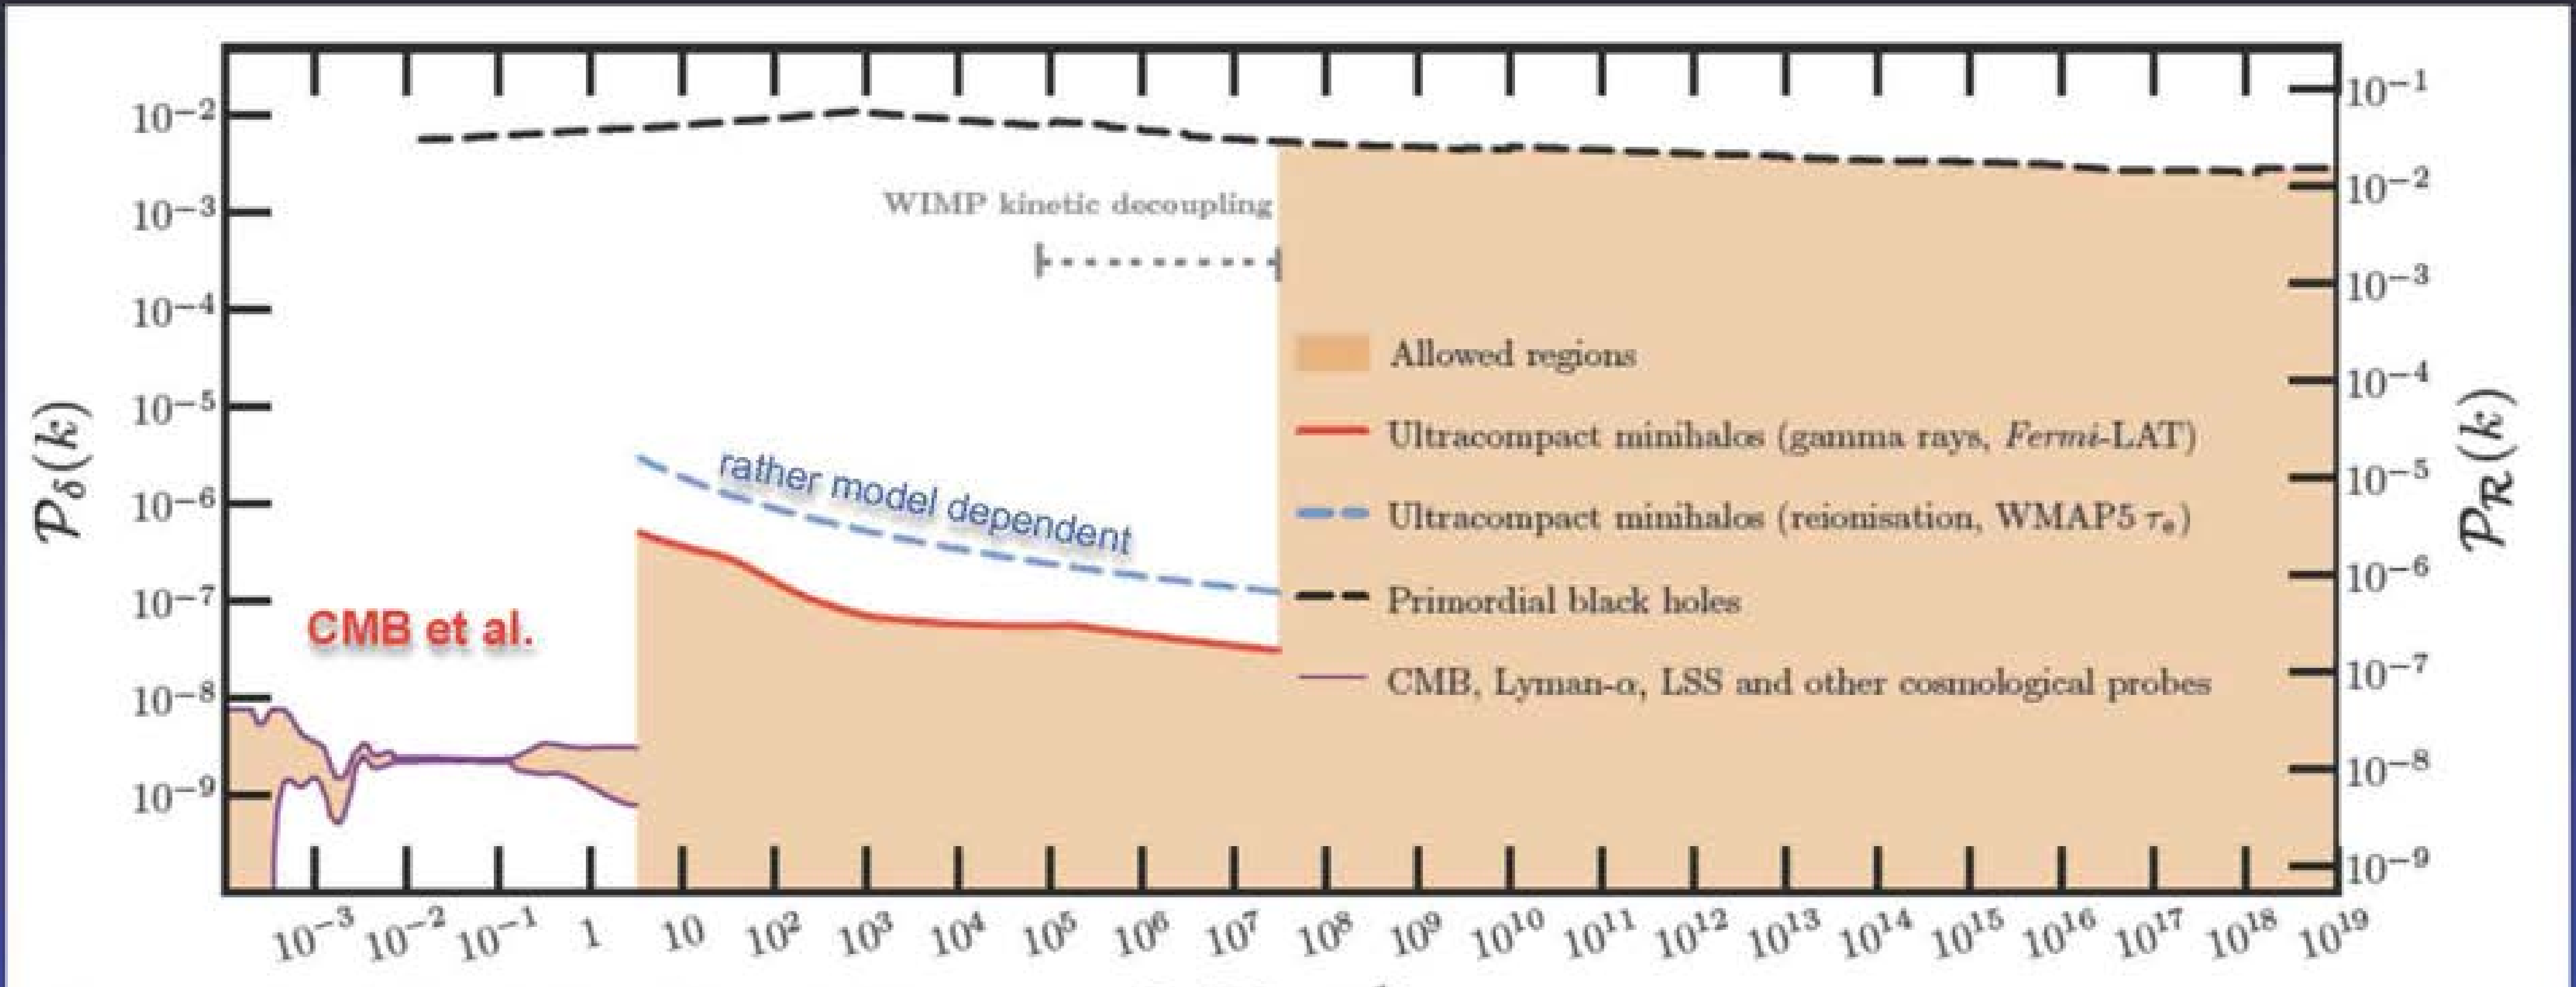


Average CMB spectral distortions



But this is not all that one could look at !!!

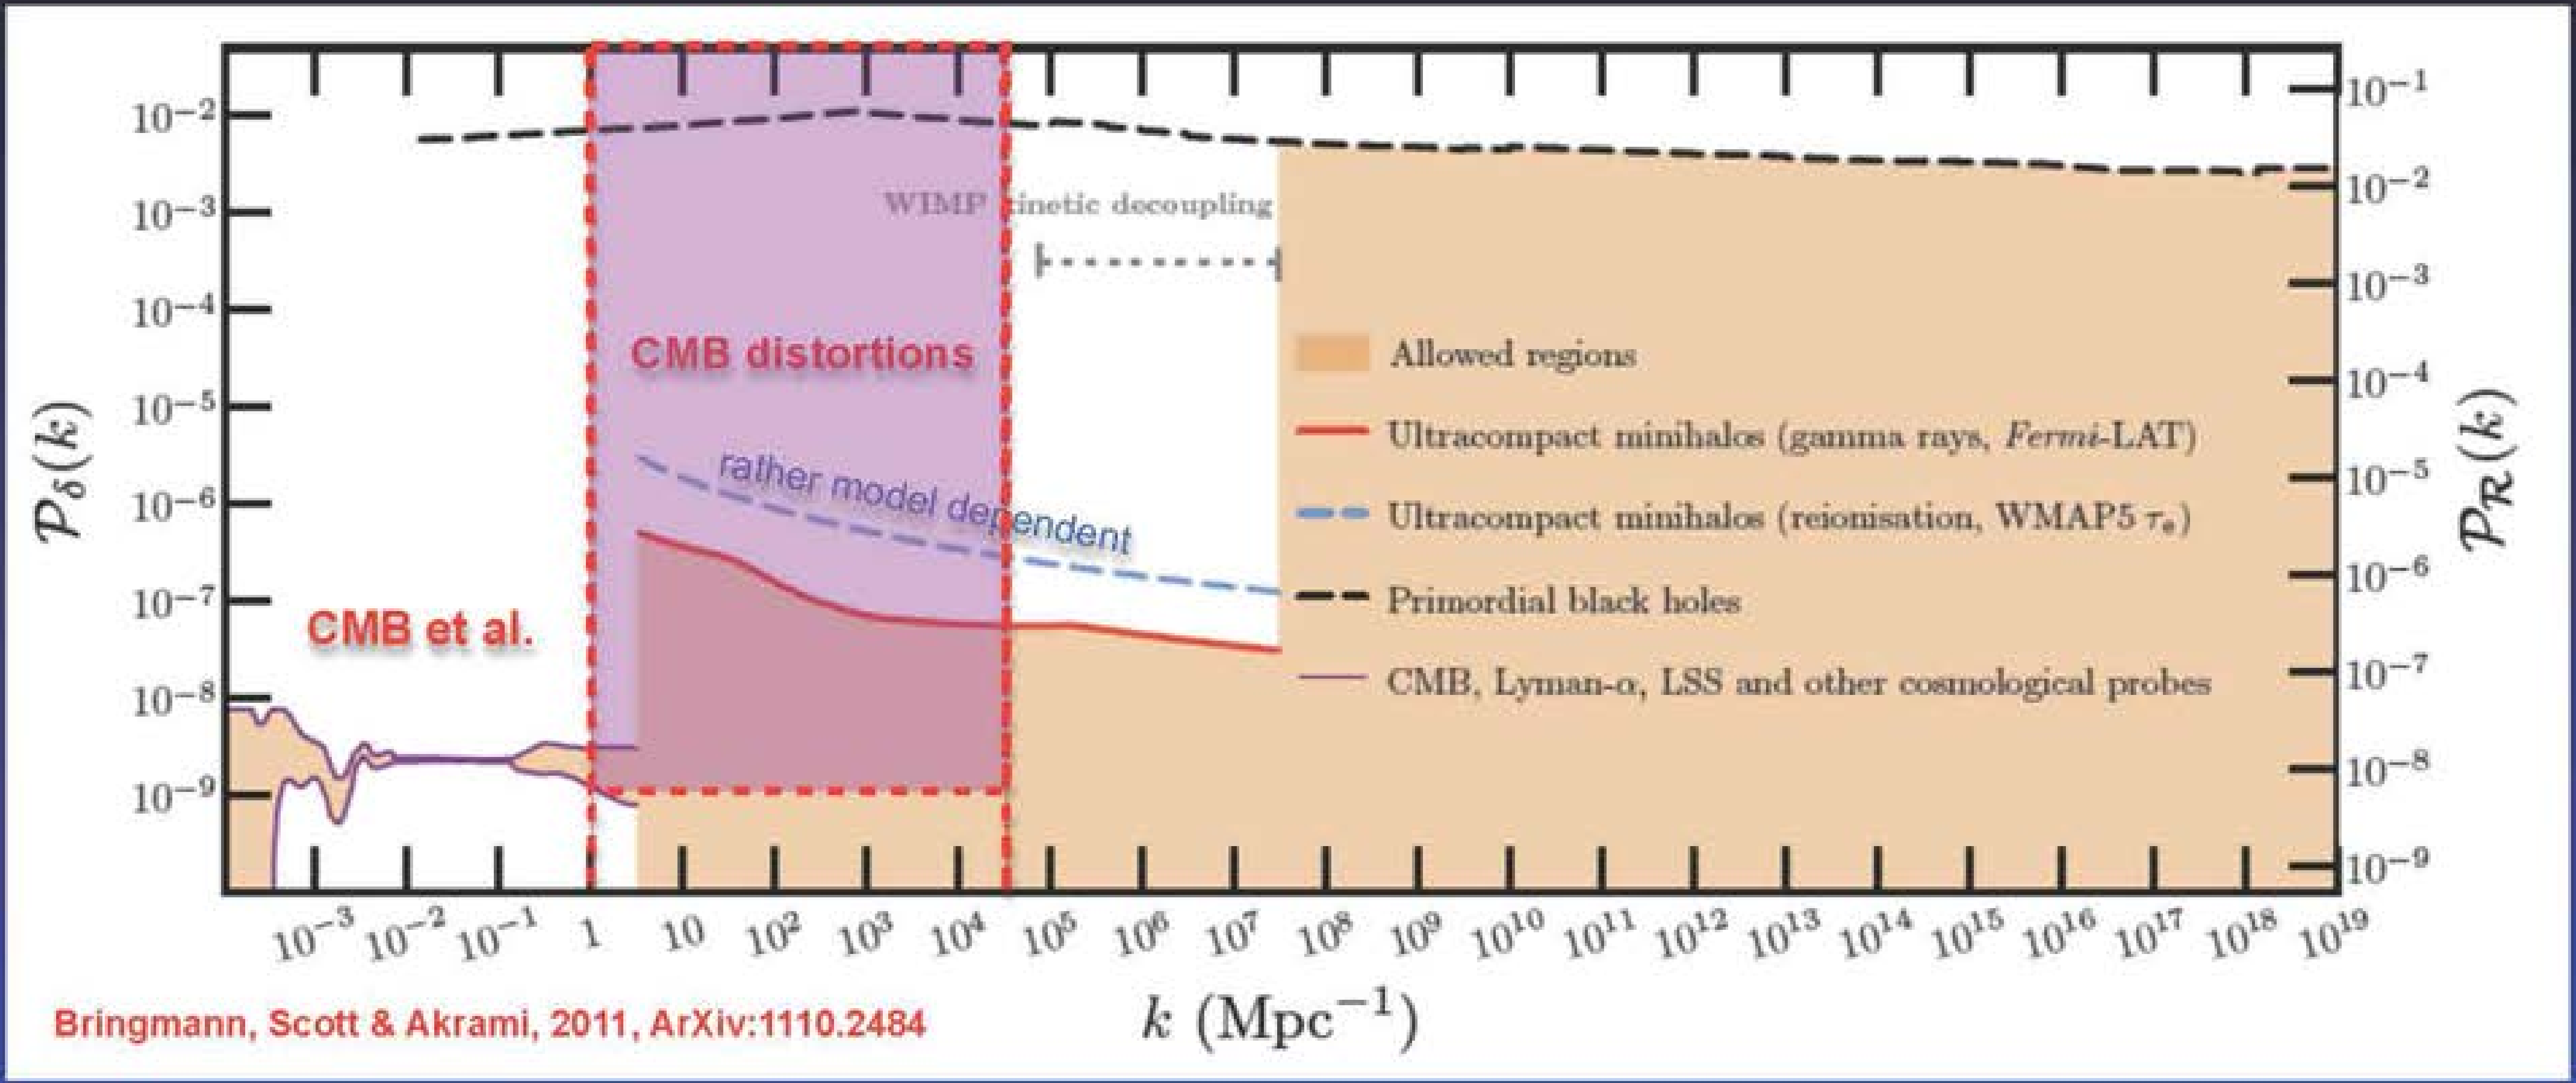
Power spectrum constraints



Bringmann, Scott & Akrami, 2011, ArXiv:1110.2484

- Amplitude of power spectrum rather uncertain at $k > 3$ Mpc^{-1}
- improving limits at smaller scales would constrain inflationary models

Power spectrum constraints



- Amplitude of power spectrum rather uncertain at $k > 3\ \mathrm{Mpc}^{-1}$
- improving limits at smaller scales would constrain inflationary models
- CMB spectral distortions could allow extending our lever arm to $k \sim 10^4\ \mathrm{Mpc}^{-1}$
- See JC, Erickcek & Ben-Dayan, 2012 for constraints on more general P(k)

The cosmological recombination radiation

Simple estimates for hydrogen recombination

Hydrogen recombination:

- per recombined hydrogen atom an energy of ~ 13.6 eV in form of photons is released
- at z ~ 1100 → $\Delta\varepsilon/\varepsilon$ ~ 13.6 eV N_b / (N_γ 2.7kT_r) ~ 10^{-9} - 10^{-8}

→ recombination occurs at redshifts $z < 10^4$

→ At that time the *thermalization* process doesn't work anymore!

→ There should be some *small* spectral distortion due to additional Ly-α and 2s-1s photons!
(Zeldovich, Kurt & Sunyaev, 1968, ZhETF, 55, 278; Peebles, 1968, ApJ, 153, 1)

→ In 1975 ***Viktor Dubrovich*** emphasized the possibility to observe the recombinational lines from n > 3 and Δn << n!

First recombination computations completed in 1968!

What would we actually learn by doing such hard job?

Cosmological Recombination Spectrum opens a way to measure:

→ **the specific *entropy* of our universe (related to $\Omega_b h^2$)**

→ **the CMB *monopole* temperature T_0**

→ ***the pre-stellar abundance of helium Y_p***

→ ***If recombination occurs as we think it does, then the lines can be predicted with very high accuracy!***

→ ***In principle allows us to directly check our understanding of the standard recombination physics***

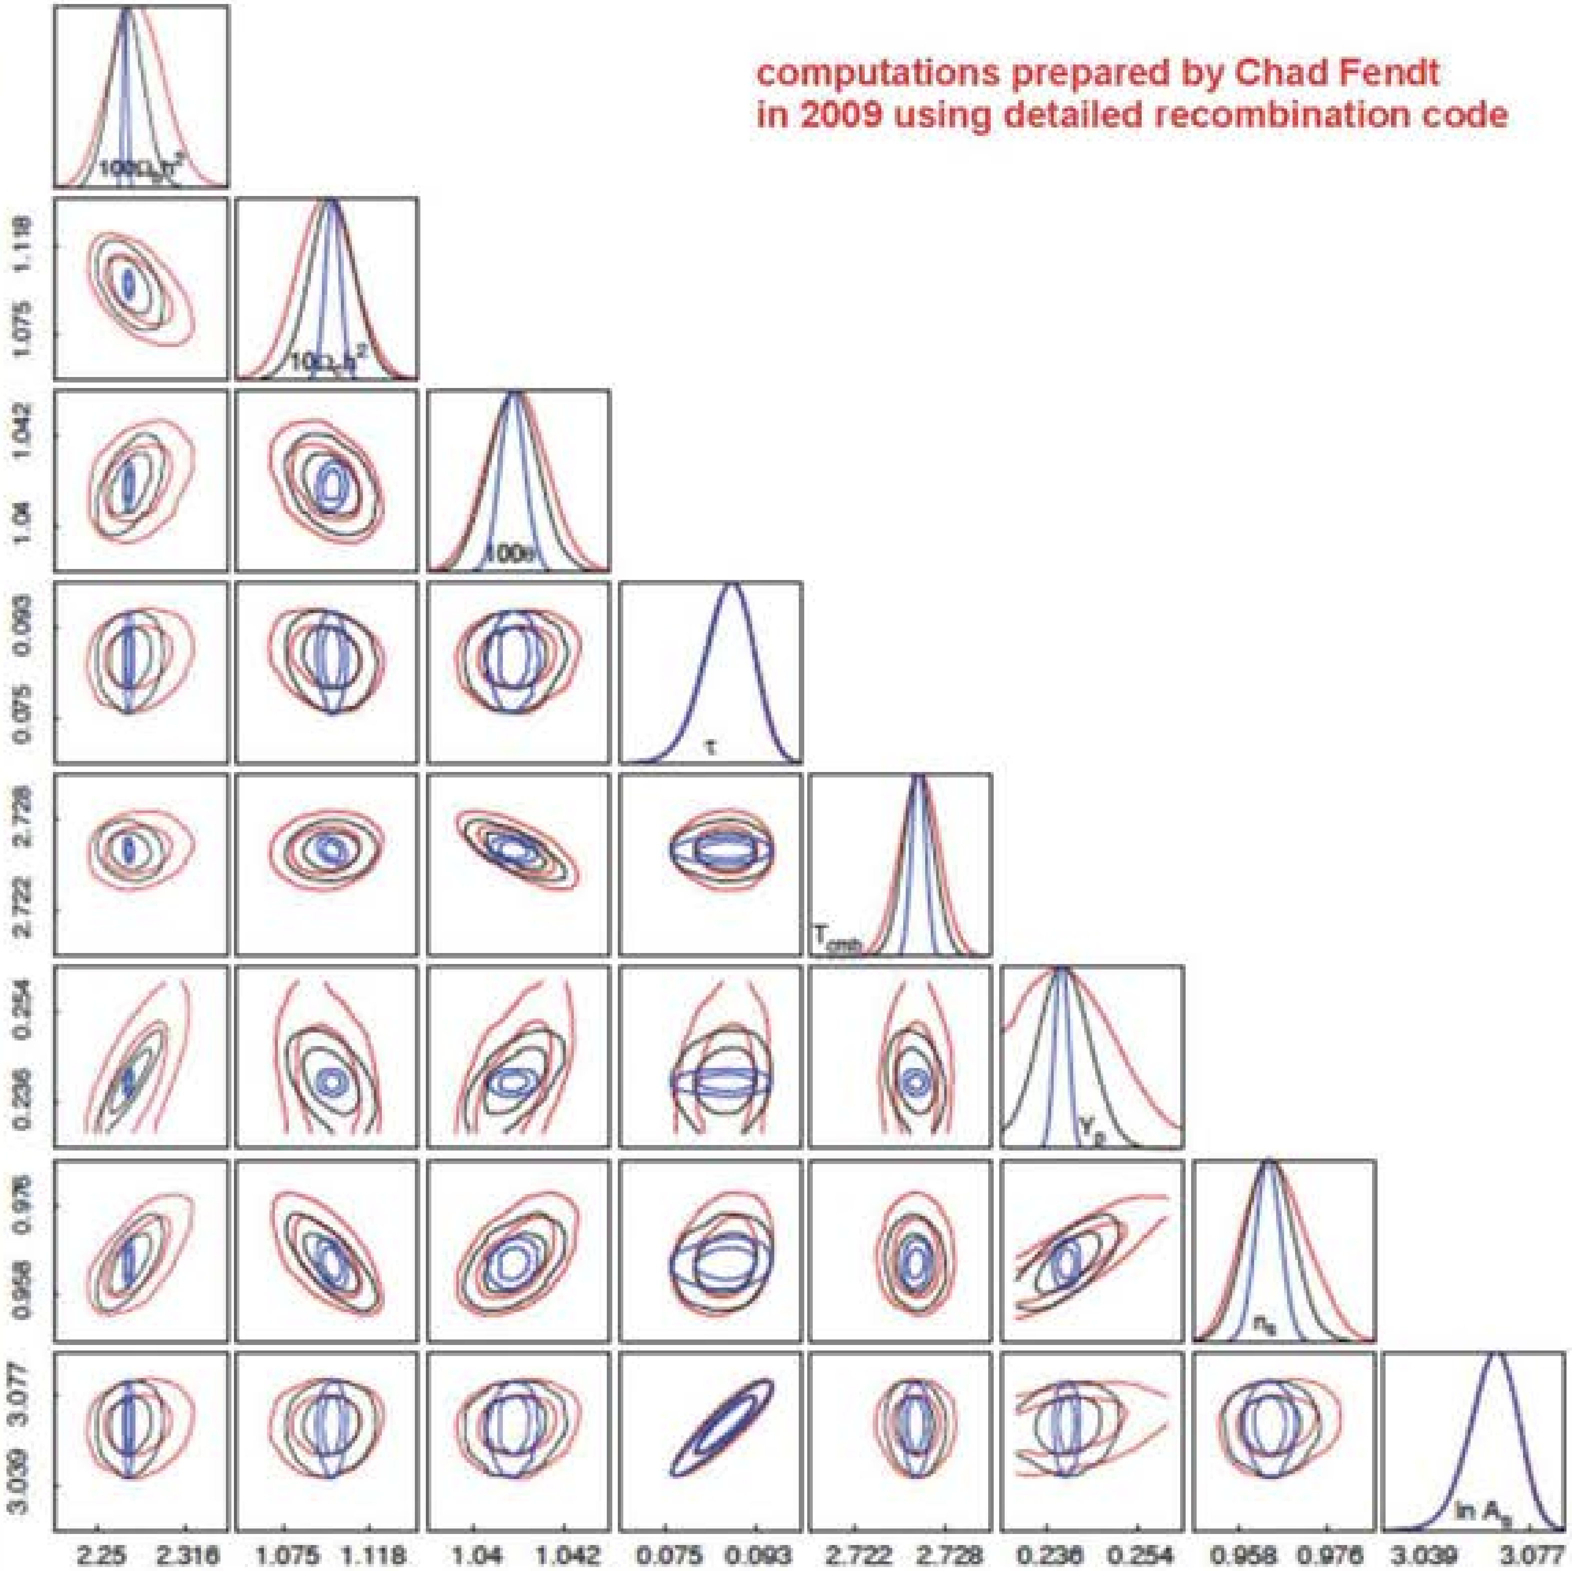

Figure 7.3: The 1 and 2 dimensional marginalized parameter posterior using the CMB spectral distortions. All three cases constrain the CMB power spectrum using a Gaussian likelihood based on Planck noise levels. The black line adds constraints due to a 10% measurement of the spectral distortions, while the blue line assumes a 1% measurement. The red line does not include the data from the spectral distortions.

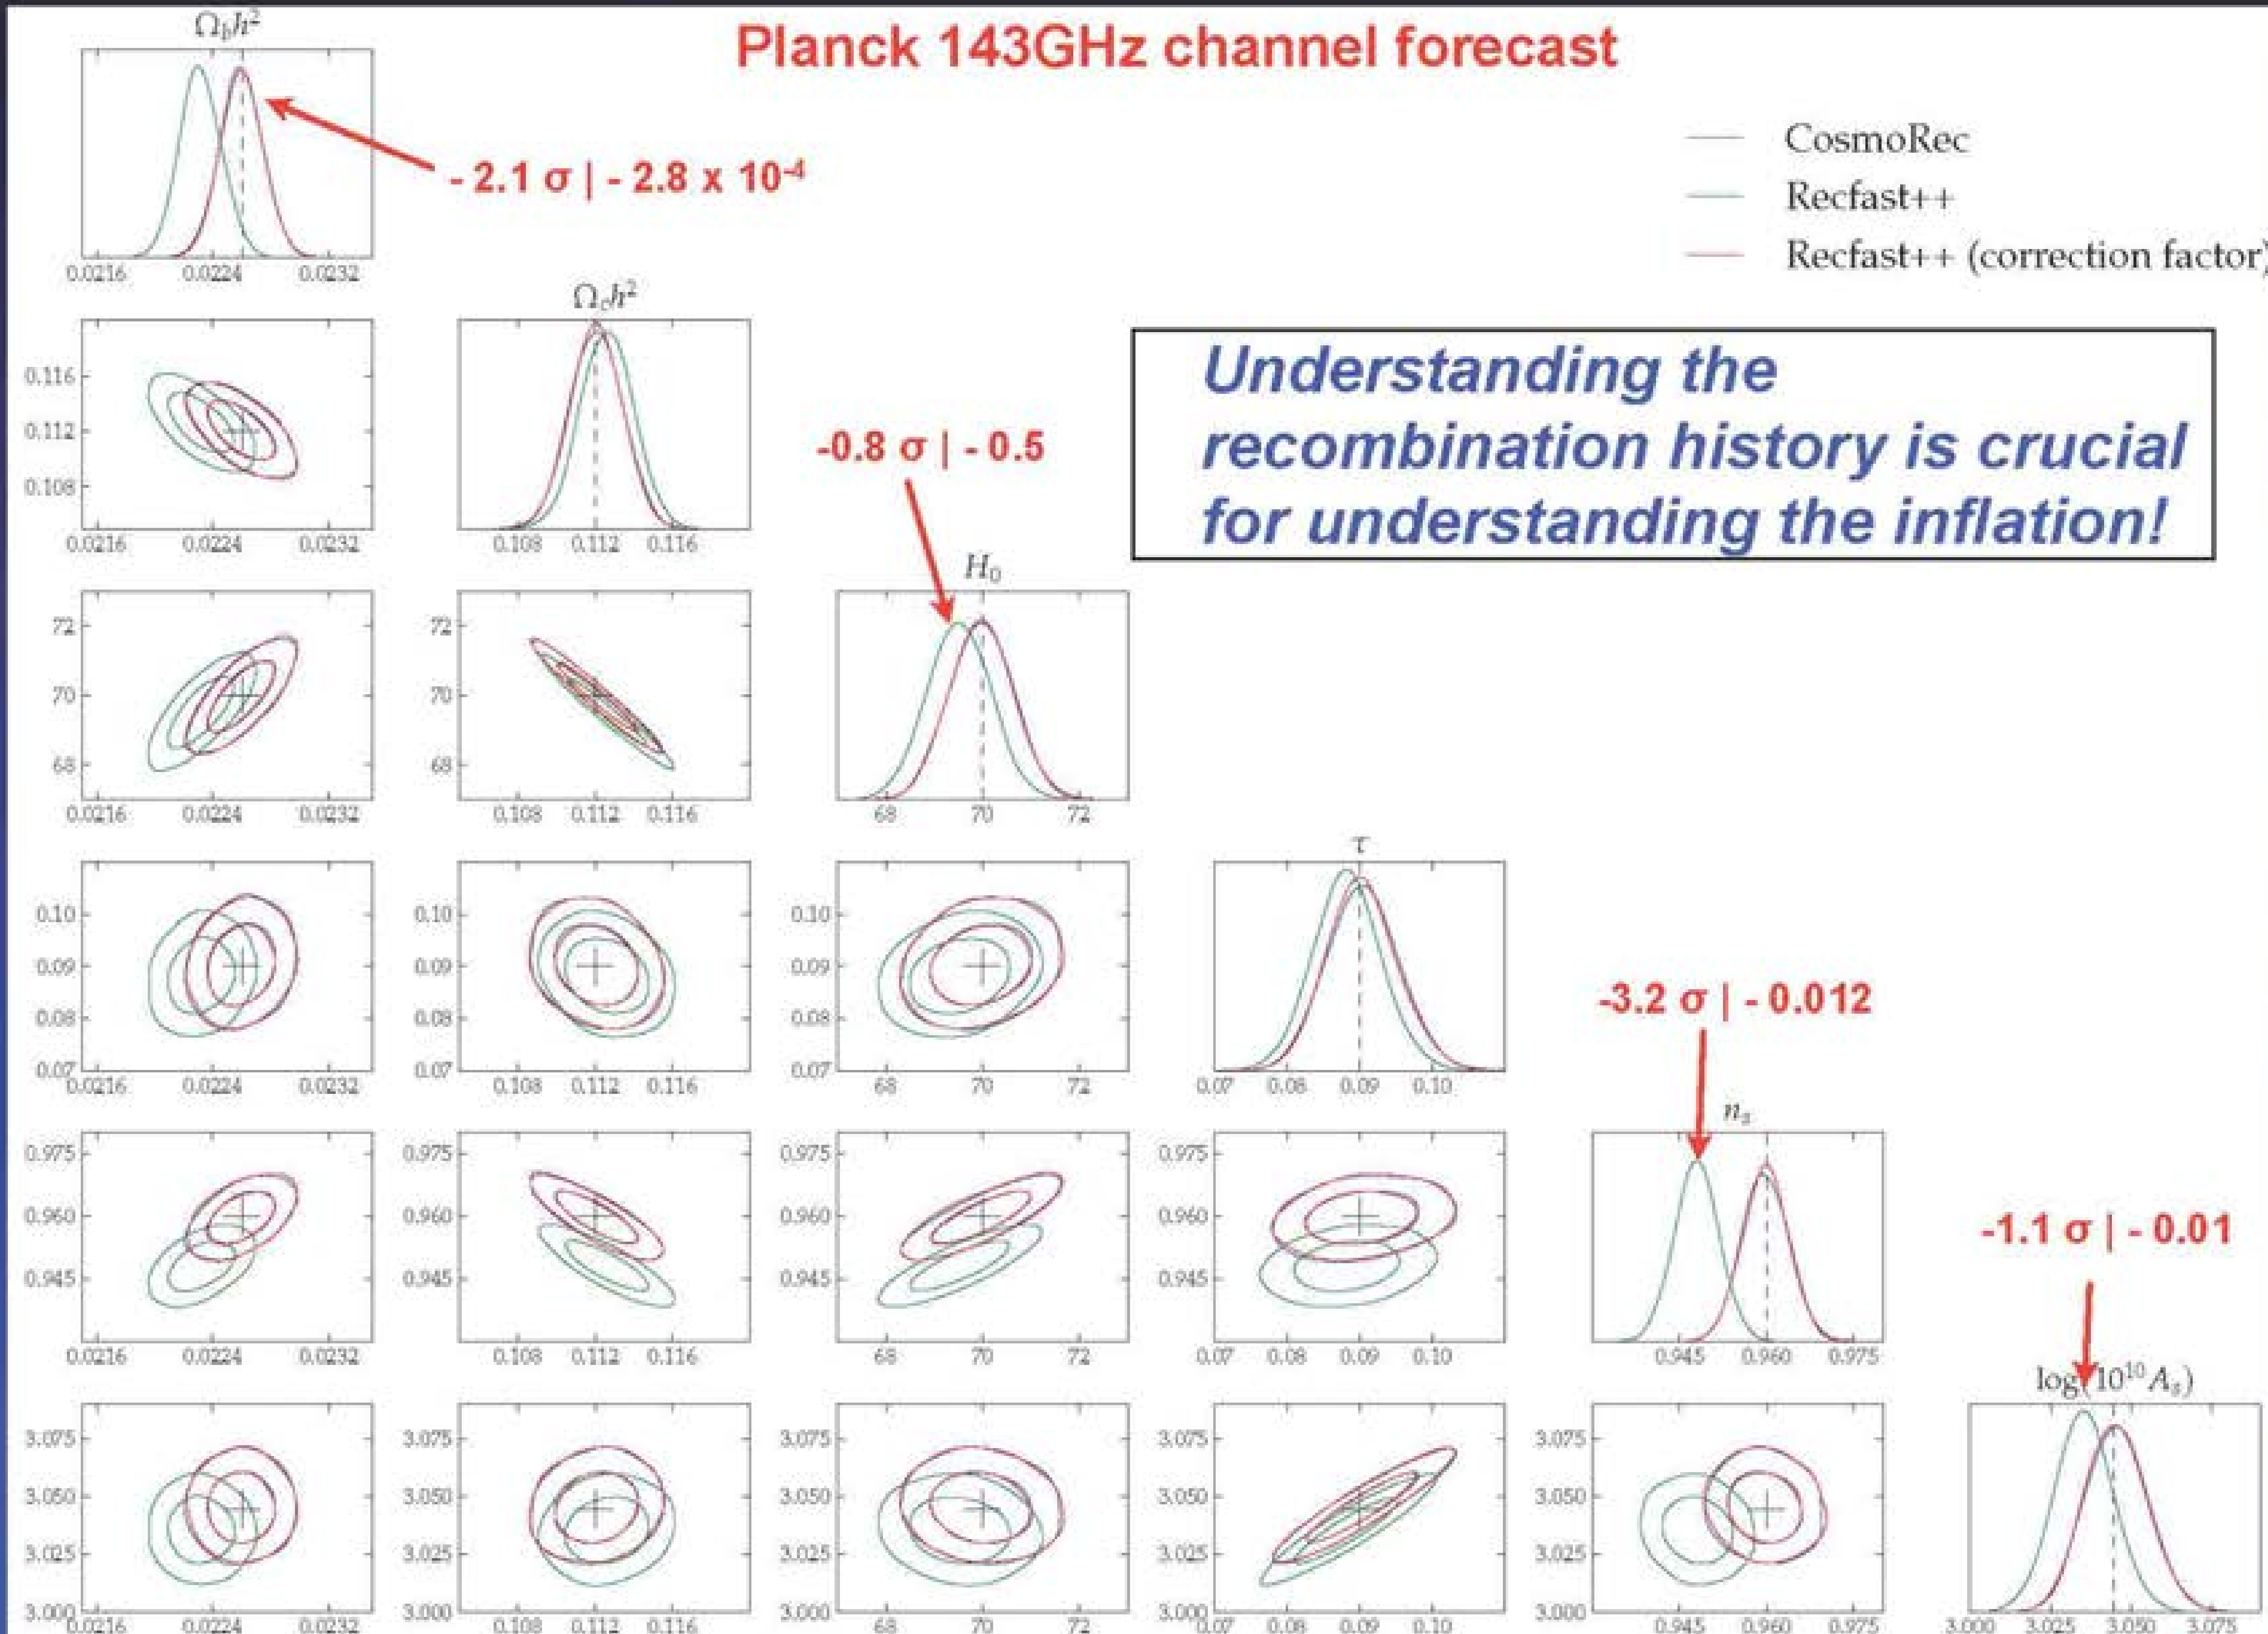
- CMB based cosmology alone
- Spectrum helps to break some of the parameter degeneracies
- Planning to provide a module that computes the recombination spectrum in a fast way
- detailed forecasts: which lines to measure; how important is the absolute amplitude; how accurately one should measure; best frequency resolution;

Importance of recombination



Shaw & JC, 2011, and references therein

Conclusions

- CMB spectral distortions open a *new window* to the early Universe and inflationary epoch
- *complementary* and *independent* source of information about our Universe *not* just confirmation
- simplicity of thermalization physics allows making very *precise predictions* for the distortions caused by different heating mechanisms
- in *standard cosmology* several processes lead to *early energy release* at a level that will be detectable in the future
- extremely interesting *future* for CMB based science!
